(54) Title: STABILIZED SINGLE DOMAIN ANTIBODIES

(57) Abstract: The present invention relates to heterospecific polypeptide constructs comprising at least one single domain antibody directed against a therapeutic and/or diagnostic target and at least one single domain antibody directed against a serum protein, said construct having a prolonged lifetime in biological circulatory systems. The invention further relates to methods for stabilising VHHS in biological circulatory systems.

WO 2004/041865 A2

## STABILIZED SINGLE DOMAIN ANTIBODIES

### FIELD OF THE INVENTION

- 5 The present invention provides heterospecific polypeptide constructs comprising one or more single domain antibodies, said constructs having improved stability *in vivo* and their use in diagnosis and therapy.

### BACKGROUND OF THE INVENTION

- 10 Polypeptide therapeutics and in particular antibody-based therapeutics have significant potential as drugs because they have exquisite specificity to their target and a low inherent toxicity. However, in order to be effective as therapeutic agent, their pharmacokinetic profile should be optimized. The majority of current antibody applications are for acute disorders.
- 15 There are however significant opportunities to develop antibody therapeutics for chronic conditions. This will require large doses of protein over a long period of time. Since the cost of antibody production in mammalian cells is high, the development of traditional antibody therapeutics for these applications has been discouraged. An alternative approach has been to express fragments of antibodies such as Fab's or single-chain Fv's in microbial expression
- 20 systems such as yeast and bacteria. These fragments however have very short circulation times *in vivo*.

- Some of the initial approaches to increase the circulation in the bloodstream of proteins and peptides were based on chemical modification, such as pegylation (US 4,179,337). Examples
- 25 of such products are PEG-Intron, i.e. pegylated interferon alpha-2b for the treatment of HCV, and treatment of chronic disorder with PEG-modified antibodies (A.P Chapman, Adv.Drug Delivery Reviews (2002), 54, 531-545). Such chemical methods, however, suffer from a number of disadvantages, such as inactivation of the target protein or peptide due to the chemical modification of certain amino acid side chains, instability of the target
- 30 protein/peptide during the chemical reaction.

To overcome these limitations, alternative approaches have been developed, first of all by using non-conventional or modified proteins, secondly by using alternative methods to increase half-life *in vivo*. Stabilisation of the protein drug can therefore be carried out by

choosing an inherently stable protein scaffold and providing methods to bind such scaffold to plasma proteins which occur in high concentrations, such as immunoglobulins or albumin. Binding to plasma protein can be an effective means to improving the pharmacokinetic properties of molecules in general. More precisely, binding to albumin to improve the half-life of proteins has been described: M.S. Dennis *et al.* (*J. Biol. Chem.* 33, 2383-90, 2002) isolated peptides having affinity for serum albumin. When bound to a Fab molecule, half-lives comparable to pegylated Fab's were obtained. Peptide ligands having affinity for IgG or serum albumin have been disclosed (WO 01/45746). Cemur Bioteknik (Nygren, Wigzell, Uhlen, EP 486525 B1; US 6,267,964) described fusions of active proteins or peptides to polypeptides from bacterial origin that bind to serum albumin (e.g. Staph A). The drawback of these peptide-based approaches is that the peptides have to fold properly and be accessible to binding to serum albumin when fused to the therapeutic protein. Therefore, these peptides are inherently unstable and have affinities in the submicromolar range rather than subnanomolar or low nanomolar range, as is the case with conventional antibodies. As part of a larger protein, such as a conventional antibody molecule, binding of these peptides to albumin may be sterically hindered.

An alternative hybrid molecule with two functional units is based on a heterospecific antibody. Such a hybrid would consist of a bifunctional or heterospecific antibody construct with one entity having specificity and affinity for the target, the second entity having specificity and affinity for a serum protein, such as albumin. However, such heterospecific constructs based on conventional antibodies or Fab fragments have several important drawbacks: these are complex, large molecules composed of two polypeptide chains (VH and VL) and therefore difficult and expensive to produce in high amounts in mammalian expression systems. Furthermore, producing bifunctional antibodies composed of 4 chains (2 VH's and 2 VL's) have the inherent risk of resulting in molecules with the unproductive VH-VL combinations and consequent loss of activity. Several alternatives have been tried with mixed results based on peptide derivatives of conventional antibodies, such as diabodies and bifunctional scFv's (WO0220615; WO9413804; WO9119739; WO9409131). Holliger *et al.* (*Nature Biotech.* 15, 632-636, 1997) suggests that binding one of the antibody fragments of a diabody (bispecific construct derived from a conventional antibody) to serum immunoglobulin (IgG) may prolong serum residence time of such diabodies but no suggestion is made that bispecific diabodies may be stabilised using antibodies against a serum protein other than serum IgG. Diabodies

are known to be inherently difficult to produce due to stickiness of their exposed surface and due to non-productive associations between the four different V-regions (2 VH+2 VL).

5 Covalent binding to serum proteins as disclosed in, for example, EP0793506B1, US 5,612,034, 6,103,233, and US20020009441 using reactive groups forming stable covalent bonds to a serum protein or a cell have the inherent disadvantage of unwanted target modification through the reactive groups.

10 Fusions to large, long lived proteins such as albumin (Syed et al, Blood 89, 3243-3252 (1997), Yeh et al, PNAS 89, 1904-1908 (1992); Celltech (WO0027435)) or N-terminal fusions of albumin polypeptides (Delta Biotech/HGS, US 5,380,712, US 5,766,883) or the Fc portion of IgG (Capon et al, Nature 337, 525-531(1989); Ashkenazi et al, Curr. Op.Immunol. 9, 195-200 (1997)) have been described. Such fusions have the disadvantage of inefficient production and causing unwanted immunological reactions .

15 A complex of interferon with a monoclonal antibody to increase the serum half-life of interferon has been described in US 5,055,289. Such approach has the inherent risk of impairing the biological activity of the interferon since the size of the construct raises the problem of steric hindrance.

20

## THE AIMS OF THE PRESENT INVENTION

It is an aim of the present invention to provide therapeutic heterospecific antibody polypeptide constructs which overcome the problems of therapeutic antibodies of the art namely, low half-life *in vivo*, poor folding, low expression, and poor stability. It is a further aim of the present invention to provide methods for providing said heterospecific antibodies .

25

## SUMMARY OF THE INVENTION

30 One embodiment of the present invention is a polypeptide construct comprising:  
- at least one single domain antibody directed against a therapeutic and/or diagnostic target, and  
- at least one single domain antibody directed against a serum protein.

Another embodiment of the present invention is a polypeptide construct as described above wherein:

- the number of anti-target single domain antibodies is at least two, and
- 5 - at least two anti-target single domain antibodies do not share the same sequence, or all the anti-target single domain antibodies share the same sequence.

One embodiment of the present invention is a polypeptide construct as described above wherein:

- 10 - the number of anti-serum protein single domain antibodies is at least two, and
- at least two anti-serum-protein single domain antibodies do not share the same sequence, or all the anti-serum-protein single domain antibodies share the same sequence.

- 15 One embodiment of the present invention is a polypeptide construct as described above wherein at least one single domain antibody is a Camelidae VHHs antibody.

One embodiment of the present invention is a polypeptide construct as described above wherein at least one single domain antibody is a humanised Camelidae VHHs antibody.

- 20 One embodiment of the present invention is a polypeptide construct as described above wherein said serum protein is any of serum albumin, serum immunoglobulins, thyroxine-binding protein, transferring, or fibrinogen or a fragment thereof.

- 25 One embodiment of the present invention is a polypeptide construct as described above wherein a single domain anti-serum protein antibody correspond to a sequence represented by any of SEQ ID NOs: 1 to 4, and 28 to 40.

- 30 One embodiment of the present invention is a polypeptide construct as described above wherein a target is TNF-alpha-alpha.

One embodiment of the present invention is a polypeptide construct as described above corresponding to the sequence represented by any of SEQ ID NO: 5 to 18.

5

One embodiment of the present invention is a polypeptide construct as described above, wherein said polypeptide construct is a homologous sequence of said polypeptide construct, a functional portion of said polypeptide construct, or an homologous sequence of a functional portion of said polypeptide construct.

5

One embodiment of the present invention is a nucleic acid encoding a polypeptide construct as described above.

10

One embodiment of the present invention is a polypeptide construct as described above, or a nucleic acid as described above for use in the treatment, prevention and/or alleviation of disorders relating to inflammatory processes.

15

One embodiment of the present invention is a use of a polypeptide construct as described above, or a nucleic acid as described above for the preparation of a medicament for the treatment, prevention and/or alleviation of disorders relating to inflammatory processes.

20

One embodiment of the present invention is a polypeptide construct or nucleic acid as described above or a use of a polypeptide construct as described above wherein said disorders are any of rheumatoid arthritis, Crohn's disease, ulcerative colitis and multiple sclerosis.

25

One embodiment of the present invention is a polypeptide construct or nucleic acid as described above or a use of a polypeptide construct as described above wherein said polypeptide construct is administered intravenously, orally, sublingually, topically, nasally, vaginally, rectally, subcutaneously or by inhalation.

One embodiment of the present invention is a polypeptide construct as described above wherein a target is vWF

30

One embodiment of the present invention is a polypeptide construct as described above wherein a target is collagen.

One embodiment of the present invention is a polypeptide construct as described above wherein at least one anti-target single domain antibody is anti-vWF VHHs.

One embodiment of the present invention is a polypeptide construct as described above  
5 corresponding to the sequence represented by any of SEQ ID NOs: 19 to 21.

One embodiment of the present invention is a polypeptide construct as described above, wherein said polypeptide construct is a homologous sequence of said polypeptide construct, a functional portion of said polypeptide construct, or an homologous sequence of a functional  
10 portion of said polypeptide construct.

One embodiment of the present invention is a nucleic acid encoding a polypeptide construct as described above.

15 One embodiment of the present invention is a polypeptide construct as described above or a nucleic acid as described above for use in the treatment, prevention and/or alleviation of disorders or conditions relating to platelet-mediated aggregation or dysfunction thereof.

One embodiment of the present invention is a use of a polypeptide construct as described  
20 above, or a nucleic acid as described above for the preparation of a medicament for the treatment, prevention and/or alleviation of disorders or conditions relating to platelet-mediated aggregation or dysfunction thereof.

One embodiment of the present invention is a polypeptide construct or nucleic acid as  
25 described above or a use of a polypeptide construct or nucleic acid as described above wherein said disorders are any of cerebral ischemic attack, unstable angina pectoris, cerebral infarction, myocardial infarction, peripheral arterial occlusive disease, restenosis, and said conditions are those arising from coronary by-pass graft, or coronary artery valve replacement and coronary interventions such angioplasty, stenting, or atherectomy.

30 One embodiment of the present invention is a polypeptide construct or nucleic acid as described above or a use of a polypeptide construct as described above wherein said

polypeptide construct is administered intravenously, orally, sublingually, topically, nasally, vaginally, rectally, subcutaneously or by inhalation.

One embodiment of the present invention is a polypeptide construct as described above  
5 wherein a target is IgE.

One embodiment of the present invention is a polypeptide construct as described above wherein at least anti-target single domain antibody is anti-IgE VHHs.

10 One embodiment of the present invention is a polypeptide construct as described above corresponding to the sequence represented by any of SEQ ID NOs: 22 to 24.

One embodiment of the present invention is a polypeptide construct as described above, wherein said polypeptide construct is a homologous sequence of said polypeptide construct,  
15 a functional portion of said polypeptide construct, or an homologous sequence of a functional portion of said polypeptide construct.

One embodiment of the present invention is a nucleic acid encoding a polypeptide construct as described above.  
20

One embodiment of the present invention is a polypeptide construct as described above, or a nucleic acid as described above for use in the treatment, prevention and/or alleviation of disorders or conditions relating to allergic reactions.

25 One embodiment of the present invention is a use of a polypeptide construct as described above, or a nucleic acid as described above for the preparation of a medicament for the treatment, prevention and/or alleviation of disorders or conditions relating to allergic reactions.

30 One embodiment of the present invention is a polypeptide construct or nucleic acid as described above or a use of a polypeptide construct or nucleic acid as described above wherein said disorders are any of hay fever, asthma, atopic dermatitis, allergic skin reactions, allergic eye reactions and food allergies.

One embodiment of the present invention is a polypeptide construct or nucleic acid as described above or a use of a polypeptide construct as described above wherein said polypeptide construct is administered intravenously, orally, sublingually, topically, nasally, vaginally, rectally, subcutaneously or by inhalation.

5

One embodiment of the present invention is a polypeptide construct as described above wherein a target is IFN-gamma .

One embodiment of the present invention is a polypeptide construct as described above wherein at least one anti-target single domain antibody is anti-IFN-gamma VHHs.

10

One embodiment of the present invention is a polypeptide construct as described above corresponding to a sequence represented by SEQ ID NOs: 25 to 27.

One embodiment of the present invention is a polypeptide construct as described above, wherein said polypeptide construct is a homologous sequence of said polypeptide construct, a functional portion of said polypeptide construct, or an homologous sequence of a functional portion of said polypeptide construct.

15

One embodiment of the present invention is a nucleic acid encoding a polypeptide construct as described above.

20

One embodiment of the present invention is a polypeptide construct as described above, or a nucleic acid as described above for use in the treatment, prevention and/or alleviation of disorders or conditions wherein the immune system is over-active.

25

One embodiment of the present invention is a use of a polypeptide construct as described above, or a nucleic acid as described above for the preparation of a medicament for the treatment, prevention and/or alleviation of disorders or conditions wherein the immune system is over-active.

30

One embodiment of the present invention is a polypeptide construct or nucleic acid as described above or a use of a polypeptide construct or nucleic acid as described above

wherein said disorders are any of Crohn's disease, autoimmune disorders and organ plant rejection in addition inflammatory disorders such as rheumatoid arthritis, Crohn's disease, ulcerative colitis and multiple sclerosis.

- 5 One embodiment of the present invention is a polypeptide construct or nucleic acid as described above or a use of a polypeptide construct as described above wherein said polypeptide construct is administered intravenously, orally, sublingually, topically, nasally, vaginally, rectally, subcutaneously or by inhalation.
- 10 One embodiment of the present invention is a composition comprising a polypeptide construct as described above, or a nucleic acid encoding said polypeptide construct and a pharmaceutically acceptable vehicle.
- One embodiment of the present invention is a composition comprising a polypeptide
- 15 construct as described above, or a nucleic acid encoding said polypeptide construct and a pharmaceutically acceptable vehicle.
- One embodiment of the present invention is a composition comprising a polypeptide
- 20 construct as described above, or a nucleic acid encoding said polypeptide construct and a pharmaceutically acceptable vehicle.
- One embodiment of the present invention is a polypeptide construct as described above directed against a single target wherein said target is involved in a disease process.
- 25 One embodiment of the present invention is a polypeptide construct as described above, wherein said polypeptide construct is a homologous sequence of said polypeptide construct, a functional portion thereof, of an homologous sequence of a functional portion thereof.
- One embodiment of the present invention is a nucleic acid encoding a polypeptide construct
- 30 as described above.

One embodiment of the present invention is a polypeptide construct as described above, or a nucleic acid as described above for use in the treatment, prevention and/or alleviation of disorders or conditions in which the target is involved.

- 5 One embodiment of the present invention is a use of a polypeptide construct as described above, or a nucleic acid as described above for the preparation of a medicament for the treatment, prevention and/or alleviation of disorders or conditions in which the target is involved.
- 10 One embodiment of the present invention is a polypeptide construct as described above, or a nucleic acid as described above for use in treating, preventing and/or alleviating the symptoms of a disease requiring a therapeutic or diagnostic compound which is not rapidly cleared from the circulation.
- 15 One embodiment of the present invention is a use of a polypeptide construct as described above, or a nucleic acid as described above for the preparation of a medicament for treating, preventing and/or alleviating the symptoms of a disease requiring a therapeutic or diagnostic compound which is not rapidly cleared from the circulation.
- 20 One embodiment of the present invention is a polypeptide construct as described above, or a nucleic acid as described above for use in treating, preventing and/or alleviating the symptoms of a disease requiring a therapeutic or diagnostic compound which remains active in the circulation for extended periods of time.
- 25 One embodiment of the present invention is a use of a polypeptide construct as described above, or a nucleic acid as described above for the preparation of a medicament for treating, preventing and/or alleviating the symptoms of a disease requiring a therapeutic or diagnostic compound which is remains active in the circulation for extended periods of time.
- 30 One embodiment of the present invention is a polypeptide construct or nucleic acid as described above, or use of a polypeptide construct or nucleic acid as described above, wherein said polypeptide construct is administered intravenously, orally, sublingually, topically, nasally, vaginally, rectally, subcutaneously or by inhalation.

One embodiment of the present invention is a composition comprising a polypeptide construct as described above, or a nucleic acid as described above and a pharmaceutically acceptable vehicle.

- 5 One embodiment of the present invention is a method of producing a as described above comprising
- (a) culturing host cells comprising nucleic acid capable of encoding a polypeptide as described above, under conditions allowing the expression of the polypeptide, and,
  - (b) recovering the produced polypeptide from the culture.

10

One embodiment of the present invention is a method as described above, wherein said host cells are bacterial or yeast.

- 15 One embodiment of the present invention is a method for prolonging the half-life of a single domain antibody in the blood stream of a subject, said antibody directed against a therapeutic and/or diagnostic target by joining thereto one or more single domain antibodies directed against a serum protein.

- 20 One embodiment of the present invention is a method as described above wherein said anti-target single domain antibodies do not share the same sequence.

One embodiment of the present invention is a method as described above wherein said anti-serum protein single domain antibodies do not share the same sequence.

- 25 One embodiment of the present invention is a method as described above wherein said single domain antibodies are Camelidae VHH antibodies.

- 30 One embodiment of the present invention is a method as described above wherein said serum protein is any of serum albumin, serum immunoglobulins, thyroxine-binding protein, transferring, or fibrinogen or a fragment thereof.

One embodiment of the present invention is a method as described above wherein said serum protein comprises a sequence corresponding to any of SEQ ID NOs: 1 to 4, a

homologous sequence, a functional portion thereof, or a homologous sequence of a functional portion thereof.

One embodiment of the present invention is a composition comprising a polypeptide as  
5 described above or a nucleic acid capable of encoding said polypeptide and a pharmaceutically acceptable vehicle.

## DETAILED DESCRIPTION OF THE INVENTION

30 The present invention relates to a heterospecific polypeptide construct comprising one or more single domain antibodies each directed against a serum protein(s) of a subject, and one or more single domain antibodies each directed against a target molecule(s) and the finding that the construct has a significantly prolonged half-life in the circulation of said subject

compared with the half-life of the anti-target single domain antibody when not part of such a construct.

Single domain antibodies are antibodies whose complementary determining regions are part  
5 of a single domain polypeptide. Examples include, but are not limited to, heavy chain  
antibodies, antibodies naturally devoid of light chains, single domain antibodies derived from  
conventional 4-chain antibodies, engineered antibodies and single domain scaffolds other  
than those derived from antibodies. Single domain antibodies may be any of the art, or any  
future single domain antibodies. Single domain antibodies may be derived from any species  
10 including, but not limited to mouse, human, camel, llama, goat, rabbit, bovine. According to  
one aspect of the invention, a single domain antibody as used herein is a naturally occurring  
single domain antibody known as heavy chain antibody devoid of light chains. Such single  
domain antibodies are disclosed in WO 9404678 for example. For clarity reasons, this  
variable domain derived from a heavy chain antibody naturally devoid of light chain is known  
15 herein as a VHH or nanobody to distinguish it from the conventional VH of four chain  
immunoglobulins. Such a VHH molecule can be derived from antibodies raised in *Camelidae*  
species, for example in camel, dromedary, alpaca and guanaco. Other species besides  
*Camelidae* may produce heavy chain antibodies naturally devoid of light chain; such VHHs  
are within the scope of the invention.

20

The one or more single domain antibodies of the polypeptide construct which are directed  
against a target may be of the same sequence. Alternatively they may not all have the same  
sequence. It is within the scope of the invention that a heterospecific polypeptide construct  
comprises anti-target single domain antibodies which do not all share the same sequence,  
25 but which are directed against the same target, or fragment thereof, one or more antigens  
thereof.

In accordance with the present invention there are provided methods for the utilization of a  
plurality of anti-target and /or anti-serum protein single domain antibodies to increase the  
30 avidity and/or affinity of the heterospecific molecule. In this manner, serum half-lives of  
molecules modified in accordance with the invention can be extended. Such modification will  
modify and/or extend the therapeutic window of a specific therapeutic molecule. This flexibility  
cannot be achieved with alternative methods in the art, such as when using peptides with

specificity to serum proteins, diabodies which are difficult to produce in a multivalent form, chemical modifications (such as pegylation, acylation).

5 The one or more single domain antibodies of the polypeptide construct which are directed against a serum protein may be of the same sequence. Alternatively they may not all have the same sequence. It is within the scope of the invention that a heterospecific polypeptide construct comprises anti-serum protein single domain antibodies which do not all share the same sequence, but which are directed against serum protein, or fragment thereof, one or more antigens thereof.

10 In another embodiment, one or more anti-target single domain antibodies of the polypeptide construct may be directed to more than one target (e.g. vWF and collagen). Similarly, the anti-serum protein single domain antibodies of the polypeptide construct may be directed against more than one serum protein (e.g. serum albumin and fibrinogen).

15 VHHs, according to the present invention, and as known to the skilled addressee are heavy chain variable domains derived from immunoglobulins naturally devoid of light chains such as those derived from *Camelids* as described in WO9404678 (and referred to hereinafter as VHH domains or nanobodies). VHH molecules are about 10x smaller than IgG molecules.

20 They are single polypeptides and very stable, resisting extreme pH and temperature conditions. Moreover, they are resistant to the action of proteases which is not the case for conventional antibodies. Furthermore, *in vitro* expression of VHHs produces high yield, properly folded functional VHHs. In addition, antibodies generated in *Camelids* will recognize epitopes other than those recognised by antibodies generated *in vitro* through the use of

25 antibody libraries or via immunisation of mammals other than *Camelids* (WO 9749805). As such, anti-albumin VHH's may interact in a more efficient way with serum albumin which is known to be a carrier protein. As a carrier protein some of the epitopes of serum albumin may be inaccessible by bound proteins, peptides and small chemical compounds. Since VHH's are known to bind into 'unusual' or non-conventional epitopes such as cavities

30 (WO9749805), the affinity of such VHH's to circulating albumin may be increased.

The present invention also relates to the finding that a heterospecific polypeptide construct comprising one or more VHHs directed against one or more serum proteins of a subject, and

one or more VHHs directed against one or more target molecule of said subject surprisingly has significantly prolonged half-life in the circulation of said subject compared with the half-life of the anti-target VHH when not part of said construct. Furthermore, such prolonged half-life is in the range of several days due to the high affinity anti-serum albumin VHH's compared to  
5 several hours when using low affinity peptides specific for albumin (Dennis et al, JBC, 277, 35035). The extension of the half-life is demonstrated by the inventors herein, for example, in Example 16, and by the polypeptide represented by SEQ ID NO: 5. Furthermore, the said construct was found to exhibit the same favourable properties of VHHs such as high stability remaining intact in mice for at least 19 days (Example 16), extreme pH resistance, high  
10 temperature stability and high target affinity.

A target according to the invention is any biological substance capable of binding to a heterospecific polypeptide construct of the invention. Targets may be, for example, proteins, peptides, nucleic acids, oligonucleic acids, saccharides, polysaccharides, glycoproteins.  
15 Examples include, but are not limited to therapeutic targets, diagnostic targets, receptors, receptor ligands, viral coat proteins, immune system proteins, hormones, enzymes, antigens, cell signaling proteins, or a fragment thereof. Targets may be native protein or a fragment thereof, a homologous sequence thereof, a functional portion thereof, or a functional portion of an homologous sequence.

20

The properties of single domain antibodies, in particular VHHs, compare favourably with those of antibodies derived from sources such as mouse, sheep, goat, rabbit etc. (*i.e.* traditional antibodies), and humanised derivatives thereof. Traditional antibodies are not stable at room temperature, and have to be refrigerated for preparation and storage, requiring  
25 necessary refrigerated laboratory equipment, storage and transport, which contribute towards time and expense. Refrigeration is sometimes not feasible in developing countries. Furthermore, the manufacture or small-scale production of said antibodies is expensive because the mammalian cellular systems necessary for the expression of intact and active antibodies require high levels of support in terms of time and equipment, and yields are very  
30 low. Furthermore, traditional antibodies have a binding activity which depends upon pH, and hence are unsuitable for use in environments outside the usual physiological pH range such as, for example, in treating gastric bleeding, gastric surgery. Furthermore, traditional antibodies are unstable at low or high pH and hence are not suitable for oral administration.

However, it has been demonstrated that VHHs resist harsh conditions, such as extreme pH, denaturing reagents and high temperatures (Ewert S et al, Biochemistry 2002 Mar 19;41(11):3628-36), so making them suitable for delivery by oral administration. Furthermore, traditional antibodies have a binding activity which depends upon temperature, and hence are  
5 unsuitable for use in assays or kits performed at temperatures outside biologically active-temperature ranges (e.g.  $37 \pm 20^{\circ}\text{C}$ ).

Furthermore VHHs are more soluble, meaning they may be stored and/or administered in higher concentrations compared with conventional antibodies. The polypeptides of the  
10 present invention also retain binding activity at a pH and temperature outside those of usual physiological ranges, which means they may be useful in situations of extreme pH and temperature which require a modulation of platelet-mediated aggregation, such as in gastric surgery, control of gastric bleeding, assays performed at room temperature etc. The polypeptides of the present invention also exhibit a prolonged stability at extremes of pH,  
15 meaning they would be suitable for delivery by oral administration. The polypeptides of the present invention may be cost-effectively produced through fermentation in convenient recombinant host organisms such as *Escherichia coli* and yeast; unlike conventional antibodies which also require expensive mammalian cell culture facilities, achievable levels of expression are high. Examples of yields of the polypeptides of the present invention are 1 to  
20 10 mg/ml (*E. coli*) and up to 1g/l (yeast). The polypeptides of the present invention also exhibit high binding affinity for a broad range of different antigen types, and ability to bind to epitopes not recognised by conventional antibodies; for example they display long CDR-based loop structures with the potential to penetrate into cavities and exhibit enzyme function inhibition. Furthermore, since binding often occurs through the CDR3 loop only, it is  
25 envisaged that peptides derived from CDR3 could be used therapeutically (Desmyter et al., *J Biol Chem*, 2001, 276: 26285-90). The polypeptides of the invention are also able to retain full binding capacity as fusion protein with an enzyme or toxin.

The present invention also relates to a heterospecific polypeptide construct comprising one or  
30 more VHHs each directed against one or more serum proteins of a subject, and one or more VHH each directed against one or more target molecules wherein the VHHs belong to the traditional class of *Camelidae* single domain heavy chain antibodies. The present invention also relates to a heterospecific polypeptide construct comprising one or more VHH each

- directed against one or more serum proteins of a subject, and one or more VHH each directed against one or more target molecules wherein the VHHs belong to a class of *Camelidae* single domain heavy chain antibodies that have human-like sequences. A VHH sequence represented by SEQ ID NO: 12 which binds to TNF-alpha and a second VHH
- 5 which binds to mouse albumin, belongs to this class of VHH peptides. As such, peptides belonging to this class show a high amino acid sequence homology to human VH framework regions and said peptides might be administered to patients directly without expectation of an unwanted immune response therefrom, and without the burden of further humanization.
- 10 A human-like class of *Camelidae* single domain antibodies represented by SEQ ID No. 1, 3 and 4 have been described in WO03035694 and contain the hydrophobic FR2 residues typically found in conventional antibodies of human origin or from other species, but compensating this loss in hydrophilicity by other substitutions at position 103 that substitutes the conserved tryptophan residue present in VH from double-chain antibodies. As such,
- 15 peptides belonging to these two classes show a high amino acid sequence homology to human VH framework regions and said peptides might be administered to a human directly without expectation of an unwanted immune response therefrom, and without the burden of further humanisation.
- 20 Therefore, one aspect of the present invention allows for the direct administration of an anti-serum albumin polypeptide, wherein the single domain antibodies belong to the humanized class of VHH, and comprise a sequence represented by any of SEQ ID NO: 1, 3 or 4 to a patient in need of the same.
- 25 A subject as used herein is any mammal having a circulatory system in which the fluid therein comprises serum proteins. Examples of circulatory system include blood and lymphatic systems. Examples of animals include, but are not limited to, rabbits, humans, goats, mice, rats, cows, calves, camels, llamas, monkeys, donkeys, guinea pigs, chickens, sheep, dogs, cats, horses etc.
- 30 One embodiment of the present invention is a heterospecific polypeptide construct comprising at least one single domain antibody directed against a therapeutic and/or diagnostic target, and at least one single domain antibodies each directed against one or

- more serum proteins or polypeptides. As already mentioned, the anti-target single domain antibodies may have the same sequence. Alternatively, at least two anti-target single domain antibodies may have the different sequences, but are directed against the same epitope or different epitopes on the same target, fragments thereof, or antigen thereof. Similarly, the
- 5 anti-serum protein single domain antibodies may have the same sequence. Alternatively, at least two anti-serum protein single domain antibodies may have the different sequences, but are directed against the same epitope or different epitopes on the same serum protein, fragments thereof, or antigen thereof.
- 10 In another embodiment of the present invention, where more than one anti-target single domain antibodies is present in the heterospecific polypeptide construct, each anti-target single domain antibody may be directed to a different target (e.g. one to vWF and one to collagen). Similarly, where more than one anti-serum protein single domain antibody is present, each anti-serum single domain antibody may be directed to a different serum protein
- 15 (e.g. one to serum albumin and one to fibrinogen).

One embodiment of the invention, is a heterospecific polypeptide, wherein an anti-serum protein single domain antibody corresponds to a sequence represented by any of SEQ ID NOs:1 to 4 and 28 to 40.

20

- The constructs disclosed herein retain the advantageous properties of single domain antibodies (e.g. VHHs) and have a prolonged lifetime in the circulation of an individual. Thus, such constructs are able to circulate in the subject's serum for several days, reducing the frequency of treatment, the inconvenience to the subject and resulting in a decreased cost of
- 25 treatment. Furthermore, it is an aspect of the invention that the half-life of the heterospecific polypeptide constructs may be controlled by the number of anti-serum protein single domain antibodies present in the construct. A controllable half-life is desirable in several circumstances, for example, in the application of a timed dose of a therapeutic heterospecific polypeptide construct, or to obtain a desired therapeutic effect.

30

According to an aspect of the invention a heterospecific polypeptide construct may be a homologous sequence of a full-length heterospecific polypeptide construct. According to another aspect of the invention, a heterospecific polypeptide construct may be a functional

portion of a full-length heterospecific polypeptide construct. According to another aspect of the invention, a heterospecific polypeptide construct may be a homologous sequence of a full-length heterospecific polypeptide construct. According to another aspect of the invention, a heterospecific polypeptide construct may be a functional portion of a homologous sequence of a full-length heterospecific polypeptide construct. According to an aspect of the invention a heterospecific polypeptide construct may comprise a sequence of a heterospecific polypeptide construct.

According to an aspect of the invention a single domain antibody used to form a heterospecific polypeptide construct may be a complete single domain antibody (e.g. a VHH) or a homologous sequence thereof. According to another aspect of the invention, a single domain antibody used to form the heterospecific polypeptide construct may be a functional portion of a complete single domain antibody. According to another aspect of the invention, a single domain antibody used to form the heterospecific polypeptide construct may be a homologous sequence of a complete single domain antibody. According to another aspect of the invention, a single domain antibody used to form the heterospecific polypeptide construct may be a functional portion of a homologous sequence of a complete single domain antibody.

According to another aspect of the invention a heterospecific polypeptide construct may be an homologous sequence of the parent sequence. According to another aspect of the invention, a heterospecific polypeptide construct may be a functional portion parent sequence. According to another aspect of the invention, a heterospecific polypeptide construct may be a functional portion of a homologous sequence of the parent sequence.

As used herein, an homologous sequence of the present invention may comprise additions, deletions or substitutions of one or more amino acids, which do not substantially alter the functional characteristics of the polypeptides of the invention. The number of amino acid deletions or substitutions is preferably up to 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69 or 70 amino acids.

A homologous sequence of the present invention may include a single domain antibody of the invention which has been humanised.

By humanised is meant mutated so that immunogenicity upon administration in human patients is minor or nonexistent. Humanising a single domain antibody, according to the present invention, comprises a step of replacing one or more of amino acids by their human counterpart as found in the human consensus sequence, without that polypeptide losing its typical character, *i.e.* the humanisation does not significantly affect the antigen binding capacity of the resulting polypeptide. Such methods are known by the skilled addressee. A humanisation technique applied to *Camelidae* VHHs may also be performed by a method comprising the replacement of any of the following residues either alone or in combination: some VHH contain typical *Camelidae* hallmark residues at position 37, 44, 45 and 47 with hydrophilic characteristics. Replacement of the hydrophilic residues by human hydrophobic residues at positions 44 and 45 (E44G and R45L) did not have an effect on binding and/or inhibition. Further humanization may be required by substitution of residues in FR 1, such as position 1, 5, 28 and 30; FR3, such as positions 74, 75, 76, 83, 84, 93 and 94; and FR4, such as position 103, 104, 108 and 111 (all numbering according to the Kabat).

One embodiment of the present invention is a method for humanizing a VHH comprising the steps of replacing of any of the following residues either alone or in combination:

FR1 position 1, 5, 28 and 30,  
the hallmark amino acid at position 44 and 45 in FR2,  
FR3 residues 74, 75, 76, 83, 84, 93 and 94 ,  
and positions 103, 104, 108 and 111 in FR4 ;  
(numbering according to the Kabat numbering).

Some *Camelidae* VHH sequences display a high sequence homology to human VH framework regions and therefore said VHH might be administered to patients directly without expectation of an immune response therefrom, and without the additional burden of humanisation. Therefore, one aspect of the present invention allows for the formation of a heterospecific polypeptide construct without humanisation of the VHH, when said VHH exhibit high homology to human VH framework regions.

A homologous sequence of the present invention may be a sequence of the invention derived from another species such as, for example, camel, llama, dromedary, alpaca, guanaco etc.

Where homologous sequence indicates sequence identity, it means a sequence which presents a high sequence identity (more than 70%, 75%, 80%, 85%, 90%, 95% or 98% sequence identity) with a single domain antibody of the invention, and is preferably characterised by similar properties of the parent sequence, namely affinity, said identity calculated using known methods.

A homologous sequence according to the present invention may refer to nucleotide sequences of more than 50, 100, 200, 300, 400, 500, 600, 800 or 1000 nucleotides able to hybridise to the reverse-complement of the nucleotide sequence capable of encoding a native sequence under stringent hybridisation conditions (such as the ones described by SAMBROOK *et al.*, Molecular Cloning, Laboratory Manuel, Cold Spring, Harbor Laboratory press, New York).

As used herein, a functional portion refers to a single domain antibody of sufficient length such that the interaction of interest is maintained with affinity of  $1 \times 10^{-6}$  M or better.

Alternatively a functional portion of a single domain antibody of the invention comprises a partial deletion of the complete amino acid sequence and still maintains the binding site(s) and protein domain(s) necessary for the binding of and interaction with the target or serum protein.

As used herein, a functional portion of a single domain antibody of the invention refers to less than 100% of the sequence (e.g., 99%, 90%, 80%, 70%, 60%, 50%, 40%, 30%, 20%, 10%, etc.), but comprising 5 or more amino acids or 15 or more nucleotides.

A portion of a single domain antibody of the invention refers to less than 100% of the sequence (e.g., 99%, 90%, 80%, 70%, 60%, 50%, 40%, 30%, 20%, 10%, etc.), but comprising 5 or more amino acids or 15 or more nucleotides.

Targets as mentioned herein such as TNF-alpha, IFN-gamma receptor, serum proteins (e.g. serum albumin, serum immunoglobulins, thyroxine-binding protein, transferrin, fibrinogen) and IFN-gamma may be fragments of said targets. Thus a target is also a fragment of said target, capable of eliciting an immune response. A target is also a fragment of said target,  
5 capable of binding to a single domain antibody raised against the full length target.

A fragment as used herein refers to less than 100% of the sequence (e.g., 99%, 90%, 80%, 70%, 60%, 50%, 40%, 30%, 20%, 10% etc.), but comprising 5, 6, 7, 8, 9, 10, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25 or more amino acids. A fragment is of sufficient length  
10 such that the interaction of interest is maintained with affinity of  $1 \times 10^{-6}$  M or better.

A fragment as used herein also refers to optional insertions, deletions and substitutions of one or more amino acids which do not substantially alter the ability of the target to bind to a single domain antibody raised against the wild-type target. The number of amino acid  
15 insertions deletions or substitutions is preferably up to 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69 or 70 amino acids.

20 The serum protein may be any suitable protein found in the serum of subject, or fragment thereof. In one aspect of the invention, the serum protein is serum albumin, serum immunoglobulins, thyroxine-binding protein, transferrin, or fibrinogen. Depending on the intended use such as the required half-life for effective treatment and/or compartmentalisation of the target antigen, the VHH-partner can be directed to one of the  
25 above serum proteins.

A single domain antibody directed against a target means single domain antibody that it is capable of binding to its target with an affinity of better than  $10^{-6}$  M.

30 The heterospecific polypeptide constructs disclosed herein may be made by the skilled artisan according to methods known in the art or any future method. For example, VHHs may be obtained using methods known in the art such as by immunising a camel and obtaining

hybridomas therefrom, or by cloning a library of single domain antibodies using molecular biology techniques known in the art and subsequent selection by using phage display.

5 The anti-serum protein single domain antibody may be directed against a polypeptide of a serum protein or a whole protein. The anti-target single domain antibody may be directed against a polypeptide of said target of the whole target. Methods for scanning a protein for immunogenic polypeptides are well known in the art.

10 The single domain antibodies may be joined using methods known in the art or any future method. For example, they may be fused by chemical cross-linking by reacting amino acid residues with an organic derivatising agent such as described by Blattler *et al*, Biochemistry 24,1517-1524; EP294703. Alternatively, the single domain antibody may be fused genetically at the DNA level *i.e.* a polynucleotide construct formed which encodes the complete polypeptide construct comprising one or more anti-target single domain antibodies and one or  
15 more anti-serum protein single domain antibodies. A method for producing bivalent or multivalent VHH polypeptide constructs is disclosed in PCT patent application WO 96/34103. One way of joining multiple single domain antibodies is via the genetic route by linking single domain antibody coding sequences either directly or *via* a peptide linker. For example, the C-terminal end of the first single domain antibody may be linked to the N-terminal end of the  
20 next single domain antibody. This linking mode can be extended in order to link additional single domain antibodies for the construction and production of tri-, tetra-, etc. functional constructs.

25 An aspect of the present invention is the administration of heterospecific polypeptide constructs according to the invention which avoids the need for injection. Conventional antibody-based therapeutics have significant potential as drugs because they have exquisite specificity to their target and a low inherent toxicity, however, they have one important drawback: these are complex, large molecules and therefore relatively unstable, and they are sensitive to breakdown by proteases. This means that conventional antibody drugs cannot be  
30 administered orally, sublingually, topically, nasally, vaginally, rectally or by inhalation because they are not resistant to the low pH at these sites, the action of proteases at these sites and in the blood and/or because of their large size. They have to be administered by injection (intravenously, subcutaneously, etc.) to overcome some of these problems. Administration by

injection requires specialist training in order to use a hypodermic syringe or needle correctly and safely. It further requires sterile equipment, a liquid formulation of the therapeutic polypeptide, vial packing of said polypeptide in a sterile and stable form and, of the subject, a suitable site for entry of the needle. Furthermore, subjects commonly experience physical and psychological stress prior to and upon receiving an injection. An aspect of the present invention overcomes these problems of the prior art, by providing the heterospecific polypeptides constructs of the present invention. Said constructs are sufficiently small, resistant and stable to be delivered orally, sublingually, topically, nasally, vaginally, rectally or by inhalation substantial without loss of activity. The heterospecific polypeptides constructs of the present invention avoid the need for injections, are not only cost/time savings, but are also more convenient and more comfortable for the subject.

One embodiment of the present invention is a heterospecific polypeptide construct comprising at least one single domain antibody directed against a target for use in treating, preventing and/or alleviating the symptoms of disorders susceptible to modulation by an anti-target therapeutic compound that is able pass through the gastric environment without being inactivated.

As known by persons skilled in the art, once in possession of said polypeptide construct, formulation technology may be applied to release a maximum amount of VHHs in the right location (in the stomach, in the colon, etc.). This method of delivery is important for treating, prevent and/or alleviate the symptoms of disorder whose targets that are located in the gut system.

An aspect of the invention is a method for treating, preventing and/or alleviating the symptoms of a disorder susceptible to modulation by a therapeutic compound that is able pass through the gastric environment without being inactivated, by orally administering to a subject a heterospecific polypeptide construct comprising one or more single domain antibodies specific for antigen related to the disorder.

Another embodiment of the present invention is a use of a heterospecific polypeptide construct as disclosed herein for the preparation of a medicament for treating, preventing and/or alleviating the symptoms of disorders susceptible to modulation by an anti-target

therapeutic compound that is able pass through the gastric environment without being inactivated.

5 An aspect of the invention is a method for delivering an anti-target therapeutic compound to the gut system without being inactivated, by orally administering to a subject a heterospecific polypeptide construct comprising one or more single domain antibodies directed against said target.

10 An aspect of the invention is a method for delivering an anti-target therapeutic compound to the bloodstream of a subject without being inactivated, by orally administering to a subject a heterospecific polypeptide construct comprising one or more single domain antibodies directed against said target.

15 Another embodiment of the present invention is a heterospecific polypeptide construct comprising at least one single domain antibody directed against a target herein for use in treating, preventing and/or alleviating the symptoms of disorders susceptible to modulation by an anti-target therapeutic compound delivered to the vaginal and/or rectal tract.

20 In a non-limiting example, a formulation according to the invention comprises a heterospecific polypeptide construct as disclosed herein comprising one or more VHHs directed against one or more targets in the form of a gel, cream, suppository, film, or in the form of a sponge or as a vaginal ring that slowly releases the active ingredient over time (such formulations are described in EP 707473, EP 684814, US 5629001).

25 An aspect of the invention is a method for treating, preventing and/or alleviating the symptoms of disorders susceptible to modulation by a therapeutic compound to the vaginal and/or rectal tract, by vaginally and/or rectally administering to a subject a heterospecific polypeptide construct comprising one or more single domain antibodies specific for antigen related to the disorder.

30 Another embodiment of the present invention is a use of a heterospecific polypeptide construct as disclosed herein for the preparation of a medicament for treating, preventing

and/or alleviating the symptoms of disorders susceptible to modulation by an anti-target therapeutic compound delivered to the vaginal and/or rectal tract without being inactivated.

5 An aspect of the invention is a method for delivering an anti-target therapeutic compound to the vaginal and/or rectal tract without being inactivated, by administering to the vaginal and/or rectal tract of a subject a heterospecific polypeptide construct comprising one or more single domain antibodies directed against said target.

10 An aspect of the invention is a method for delivering an anti-target therapeutic compound to the bloodstream of a subject without being inactivated, by administering to the vaginal and/or rectal tract of a subject a heterospecific polypeptide construct comprising one or more single domain antibodies directed against said target.

15 Another embodiment of the present invention is a heterospecific polypeptide construct comprising at least one single domain antibody directed against a target comprising at least one single domain antibody directed against a target, for use in treating, preventing and/or alleviating the symptoms of disorders susceptible to modulation by an anti-target therapeutic compound delivered to the nose, upper respiratory tract and/or lung.

20 In a non-limiting example, a formulation according to the invention, comprises a heterospecific polypeptide construct as disclosed herein directed against one or more targets in the form of a nasal spray (e.g. an aerosol) or inhaler. Since the construct is small, it can reach its target much more effectively than therapeutic IgG molecules.

25 An aspect of the invention is a method for treating, preventing and/or alleviating the symptoms of disorders susceptible to modulation by a therapeutic compound delivered to the upper respiratory tract and lung, by administering to a subject a heterospecific polypeptide construct as disclosed herein wherein one or more single domain antibodies are specific for an antigen related to the disorder, by inhalation through the mouth or nose.

30

Another aspect of the invention is a dispersible VHH composition, in particular dry powder dispersible VHH compositions, such as those described in US 6514496. These dry powder compositions comprise a plurality of discrete dry particles with an average particle size in the

range of 0.4-10 mm. Such powders are capable of being readily dispersed in an inhalation device. VHH's are particularly suited for such composition as lyophilized material can be readily dissolved (in the lung subsequent to being inhaled) due to its high solubilisation capacity (Muyldermans, S., Reviews in Molecular Biotechnology, 74, 277-303, (2001)).

5 Alternatively, such lyophilized VHH formulations can be reconstituted with a diluent to generate a stable reconstituted formulation suitable for subcutaneous administration. For example, anti-IgE antibody formulations (Example 1; US 6267958, EP 841946) have been prepared which are useful for treating allergic asthma.

10 Another embodiment of the present invention is a use of a heterospecific polypeptide construct as disclosed herein for the preparation of a medicament for treating, preventing and/or alleviating the symptoms of disorders susceptible to modulation by an anti-target therapeutic compound delivered to the nose, upper respiratory tract and/or lung without being inactivated.

15 An aspect of the invention is a method for delivering an anti-target therapeutic compound to the nose, upper respiratory tract and lung, by administering to the nose, upper respiratory tract and/or lung of a subject a heterospecific polypeptide construct comprising one or more single domain antibodies directed against said target.

20 An aspect of the invention is a method for delivering an anti-target therapeutic compound to the nose, upper respiratory tract and/or lung without being inactivated, by administering to the nose, upper respiratory tract and/or lung of a subject a heterospecific polypeptide construct comprising one or more single domain antibodies directed against said target.

25 An aspect of the invention is a method for delivering an anti-target therapeutic compound to the bloodstream of a subject without being inactivated by administering to the nose, upper respiratory tract and/or lung of a subject a heterospecific polypeptide construct comprising one or more single domain antibodies directed against said target.

30 One embodiment of the present invention is a heterospecific polypeptide construct as disclosed herein for use in treating, preventing and/or alleviating the symptoms of disorders susceptible to modulation by an anti-target therapeutic compound delivered to the intestinal

mucosa, wherein said disorder increases the permeability of the intestinal mucosa. Because of their small size, a heterospecific polypeptide construct as disclosed herein can pass through the intestinal mucosa and reach the bloodstream more efficiently in subjects suffering from disorders which cause an increase in the permeability of the intestinal mucosa.

5

An aspect of the invention is a method for treating, preventing and/or alleviating the symptoms of disorders susceptible to modulation by an anti-target therapeutic compound delivered to the intestinal mucosa, wherein said disorder increases the permeability of the intestinal mucosa, by orally administering to a subject a heterospecific polypeptide construct as disclosed herein.

10

This process can be even further enhanced by an additional aspect of the present invention - the use of active transport carriers. In this aspect of the invention, VHH is fused to a carrier that enhances the transfer through the intestinal wall into the bloodstream. In a non-limiting example, this "carrier" is a second VHH which is fused to the therapeutic VHH. Such fusion constructs are made using methods known in the art. The "carrier" VHH binds specifically to a receptor on the intestinal wall which induces an active transfer through the wall.

15

Another embodiment of the present invention is a use of a heterospecific polypeptide construct as disclosed herein for the preparation of a medicament for treating, preventing and/or alleviating the symptoms of disorders susceptible to modulation by an anti-target therapeutic compound delivered to the intestinal mucosa, wherein said disorder increases the permeability of the intestinal mucosa.

20

An aspect of the invention is a method for delivering an anti-target therapeutic compound to the intestinal mucosa without being inactivated, by administering orally to a subject a heterospecific polypeptide construct of the invention.

25

An aspect of the invention is a method for delivering an anti-target therapeutic compound to the bloodstream of a subject without being inactivated, by administering orally to a subject a heterospecific polypeptide construct of the invention.

30

This process can be even further enhanced by an additional aspect of the present invention - the use of active transport carriers. In this aspect of the invention, a heterospecific polypeptide construct as described herein is fused to a carrier that enhances the transfer through the intestinal wall into the bloodstream. In a non-limiting example, this "carrier" is a VHH which is fused to said polypeptide. Such fusion constructs made using methods known in the art. The "carrier" VHH binds specifically to a receptor on the intestinal wall which induces an active transfer through the wall.

One embodiment of the present invention is a heterospecific polypeptide construct comprising at least one single domain antibody directed against a target for use in treating, preventing and/or alleviating the symptoms of disorders susceptible to modulation by an anti-target therapeutic compound that is able pass through the tissues beneath the tongue effectively. A formulation of said polypeptide construct as disclosed herein, for example, a tablet, spray, drop is placed under the tongue and adsorbed through the mucus membranes into the capillary network under the tongue.

An aspect of the invention is a method for treating, preventing and/or alleviating the symptoms of disorders susceptible to modulation by a therapeutic compound that is able pass through the tissues beneath the tongue effectively, by sublingually administering to a subject a VHH specific for an antigen related to the disorder.

Another embodiment of the present invention is a use of a heterospecific polypeptide construct as disclosed herein for the preparation of a medicament for treating, preventing and/or alleviating the symptoms of disorders susceptible to modulation by an anti-target therapeutic compound that is able to pass through the tissues beneath the tongue.

An aspect of the invention is a method for delivering an anti-target therapeutic compound to the tissues beneath the tongue without being inactivated, by administering orally to a subject a heterospecific polypeptide construct comprising one or more single domain antibodies directed against said target.

An aspect of the invention is a method for delivering an anti-target therapeutic compound to the bloodstream of a subject without being inactivated, by administering orally to a subject a

heterospecific polypeptide construct comprising one or more single domain antibodies directed against said target.

One embodiment of the present invention is a heterospecific polypeptide construct comprising at least one single domain antibody for use in treating, preventing and/or alleviating the symptoms of disorders susceptible to modulation by an anti-target therapeutic compound that is able pass through the skin effectively. A formulation of said polypeptide construct, for example, a cream, film, spray, drop, patch, is placed on the skin and passes through.

10

An aspect of the invention is a method for treating, preventing and/or alleviating the symptoms of disorders susceptible to modulation by a therapeutic compound that is able pass through the skin effectively, by topically administering to a subject a heterospecific polypeptide construct as disclosed herein comprising one or more single domain antibodies specific for an antigen related to the disorder.

15

Another aspect of the invention is the use of a heterospecific polypeptide construct as disclosed herein as a topical ophthalmic composition for the treatment of ocular disorder, such as allergic disorders, which method comprises the topical administration of an ophthalmic composition comprising polypeptide construct as disclosed herein, said construct comprising one or more anti-IgE VHH (Example 1, Example 2).

20

Another embodiment of the present invention is a use of a heterospecific polypeptide construct as disclosed herein for the preparation of a medicament for treating, preventing and/or alleviating the symptoms of disorders susceptible to modulation by an anti-target therapeutic compound that is able pass through the skin effectively.

25

An aspect of the invention is a method for delivering an anti-target therapeutic compound to the skin without being inactivated, by administering topically to a subject a heterospecific polypeptide construct comprising one or more single domain antibodies directed against said target.

30

An aspect of the invention is a method for delivering an anti-target therapeutic compound to the bloodstream of a subject, by administering topically to a subject a heterospecific polypeptide construct comprising one or more single domain antibodies directed against said target.

5

In another embodiment of the present invention, a heterospecific polypeptide construct further comprises a carrier single domain antibody (e.g. VHH) which acts as an active transport carrier for transport said heterospecific polypeptide construct, the lung lumen to the blood.

- 10 A polypeptide construct further comprising a carrier binds specifically to a receptor present on the mucosal surface (bronchial epithelial cells) resulting in the active transport of the polypeptide from the lung lumen to the blood. The carrier single domain antibody may be fused to the polypeptide construct. Such fusion constructs made using methods known in the art and are describe herein. The "carrier" single domain antibody binds specifically to a  
15 receptor on the mucosal surface which induces an active transfer through the surface.

- Another aspect of the present invention is a method to determine which single domain antibodies (e.g. VHHs) are actively transported into the bloodstream upon nasal administration. Similarly, a naïve or immune VHH phage library can be administered nasally,  
20 and after different time points after administration, blood or organs can be isolated to rescue phages that have been actively transported to the bloodstream. A non-limiting example of a receptor for active transport from the lung lumen to the bloodstream is the Fc receptor N (FcRn). One aspect of the invention includes the VHH molecules identified by the method. Such VHH can then be used as a carrier VHH for the delivery of a therapeutic VHH to the  
25 corresponding target in the bloodstream upon nasal administration.

- One embodiment of the present invention is a heterospecific polypeptide construct for use in treating, preventing and/or alleviating the symptoms of disorders requiring the delivery of a therapeutic compound intravenously. An aspect of the invention is a method for treating, preventing and/or alleviating the symptoms of disorders requiring the delivery of a therapeutic  
30 compound via the bloodstream.

Another embodiment of the present invention is a heterospecific polypeptide construct as disclosed herein for use in treating, preventing and/or alleviating the symptoms of a disorder requiring a therapeutic or diagnostic compound which is not rapidly cleared from the circulation. An aspect of the invention is the use of a said construct for the preparation of a medicament for treating, preventing and/or alleviating the symptoms of a disorder requiring a therapeutic or diagnostic compound which is not rapidly cleared from the circulation. Another aspect of the invention is a method for treating, preventing and/or alleviating the symptoms of a disorder requiring a therapeutic or diagnostic compound which is not rapidly cleared from the circulation by administering a heterospecific polypeptide construct as disclosed herein to an individual. According to the present invention, the anti-target single domain antibody of said heterospecific polypeptide is directed against a target involved in a cause or a manifestation of said disorder, or involved in causing symptoms thereof. By using a heterospecific polypeptide construct of the present invention to treat or diagnose an aforementioned disorder, the depletion of said construct is retarded.

Another embodiment of the present invention is a heterospecific polypeptide construct as disclosed herein for use in treating, preventing and/or alleviating the symptoms of a disorder requiring a therapeutic or diagnostic compound which remains active in the circulation for extended periods of time. An aspect of the invention is the use of said construct for the preparation of a medicament for treating, preventing and/or alleviating the symptoms of a disorder requiring a therapeutic or diagnostic compound which remains active in the circulation for extended periods of time. Another aspect of the invention is a method for treating, preventing and/or alleviating the symptoms of a disorder requiring a therapeutic or diagnostic compound that is able to circulate in the patients serum for several days, by administering a heterospecific polypeptide construct as disclosed herein to an individual. According to the present invention, the anti-target single domain antibody of said heterospecific polypeptide is directed against a target involved in a cause or a manifestation of said disorder, or involved in causing symptoms thereof. By using a heterospecific polypeptide construct of the present invention to treat or diagnose an aforementioned disorder, the frequency of treatment is reduced, so resulting in a decreased cost of treatment.

Another embodiment of the present invention is a heterospecific polypeptide construct as disclosed herein for use in treating, preventing and/or alleviating the symptoms of a disorder

- relating to allergies. An aspect of the invention is the use of said construct for the preparation of a medicament for treating, preventing and/or alleviating the symptoms of a disorder relating to allergies. Another aspect of the invention is a method for treating, preventing and/or alleviating the symptoms of a disorder relating to allergies, by administering a heterospecific polypeptide construct as disclosed herein to an individual. According to the present invention, the anti-target single domain antibody of said heterospecific polypeptide is directed against a target involved in a cause or a manifestation of said disorder, or involved in causing symptoms thereof.
- 10 The above aspects and embodiments of the invention also apply when an anti-serum single domain antibody of the aforementioned heterospecific polypeptide constructs corresponds to a sequence represented by SEQ ID NOs: 1 to 4, a homologous sequence thereof, a functional portion thereof, or a homologous sequence of a functional portion.
- 15 The above aspects and embodiments of the invention also apply when a heterospecific polypeptide construct of the invention corresponds to a sequence represented by any of SEQ ID NOs: 5 to 18, a homologous sequence thereof, a functional portion thereof, or a homologous sequence of a functional portion. Said sequences comprise an anti-TNF-alpha *Camelidae* VHH.
- 20 The above aspects and embodiments of the invention also apply when an heterospecific polypeptide constructs of the invention corresponds to a sequence represented by any of SEQ ID NOs: 19 to 21 a homologous sequence thereof, a functional portion thereof, or a homologous sequence of a functional portion. Said sequences comprise an anti-vWF *Camelidae* VHH.
- 25 The above aspects and embodiments of the invention also apply when an heterospecific polypeptide constructs of the invention corresponds to a sequence represented by any of SEQ ID NOs: 22 to 24 a homologous sequence thereof, a functional portion thereof. Said sequences comprise an anti-IgE *Camelidae* VHH.
- 30 The above aspects and embodiments of the invention also apply when an heterospecific polypeptide construct according to the invention corresponds to a sequence represented by

any of SEQ ID NOs:25 to 27, a homologous sequence thereof, a functional portion thereof, or a homologous sequence of a functional portion. Said sequences comprise an anti-Interferon-gamma *Camelidae* VHH.

5 A non-limiting example, in relation to allergies, of a target against which an anti-target single domain antibody may be directed is IgE. During their lifetime, subjects can develop an allergic response to harmless parasites such as *Dermatophagoides pteronyssinus*, the house dust mite or to substances such as clumps, plastics, metals. This results in an induction of IgE molecules that initiates a cascade of immunological responses. One aspect of the present  
10 invention is a heterospecific polypeptide construct comprising one or more anti-IgE single domain antibodies fused to one or more anti-serum protein single domain antibodies. In one aspect of the invention, said anti-IgE single domain antibodies prevents the interaction of IgE with their receptor(s) on mast cells and basophils, so blocking initiation of the immunological cascade and a subsequent allergic reaction. In another aspect an anti-serum protein single  
15 domain antibody is directed to one of the subject's serum proteins. A heterospecific polypeptide construct as disclosed herein thus reduces or prevents an allergic response due to common or unusual allergens. Furthermore, the construct has a prolonged lifetime in the blood so increasing the therapeutic window.

7

20 Tumor necrosis factor alpha (TNF-alpha) is believed to play an important role in various diseases, for example in inflammatory diseases such as rheumatoid arthritis, Crohn's disease, ulcerative colitis and multiple sclerosis. Both TNF-alpha and the receptors (CD120a, CD120b) have been studied in great detail. TNF-alpha in its bioactive form is a trimer and the groove formed by neighboring subunits is important for the cytokine-receptor interaction.  
25 Several strategies to antagonize the action of the cytokine have been developed and are currently used to treat various disease states.

A TNF inhibitor which has sufficient specificity and selectivity to TNF may be an efficient prophylactic or therapeutic pharmaceutical compound for preventing or treating inflammatory  
30 diseases. However, it is extremely difficult and a lengthy process to develop a small chemical entity (NCE) with sufficient potency and selectivity to such target sequence. Antibody-based therapeutics on the other hand have significant potential as drugs because they have exquisite specificity to their target and a low inherent toxicity. In addition, the development

time can be reduced considerably when compared to the development of new chemical entities (NCE's). However, conventional antibodies are difficult to elicit against multimeric proteins where the receptor-binding domain of the ligand is embedded in a groove, as is the case with TNF-alpha.

5

The heterospecific polypeptide constructs of the present invention, wherein the anti-target single domain antibody is directed against TNF-alpha overcome the problems experienced using peptide therapeutics of the art because of the properties such as stability, size, and reliable expression. Furthermore, the inventors have found that, despite presence of a groove in multimeric TNF-alpha, the heterospecific polypeptide constructs are still able to achieve strong binding to TNF-alpha

10

Another embodiment of the present invention is a heterospecific polypeptide construct as disclosed herein for use in treating, preventing and/or alleviating the symptoms of a disorder mediated by inflammatory molecules. An aspect of the invention is the use of said construct for the preparation of a medicament for treating, preventing and/or alleviating the symptoms of a disorder mediated by inflammatory molecules. Another aspect of the invention is a method for treating, preventing and/or alleviating the symptoms of a disorder mediated by inflammatory molecules, by administering a heterospecific polypeptide construct as disclosed herein to an individual. According to the present invention, an anti-target single domain antibody of said heterospecific polypeptide is directed against a target involved in a cause or a manifestation of said disorder, or involved in causing symptoms thereof.

15

20

According to one aspect of the invention, a target against which a single domain antibody of a heterospecific polypeptide construct is directed is tumor necrosis factor alpha (TNF-alpha). TNF-alpha is believed to play an important role in various disorders, for example in inflammatory disorders such as rheumatoid arthritis, Crohn's disease, ulcerative colitis and multiple sclerosis.

25

Anti-target single domain antibodies may be directed against whole TNF-alpha or a fragment thereof, or a fragment of a homologous sequence thereof.

30

One aspect of the present invention relates to a heterospecific polypeptide construct comprising one or more anti-TNF-alpha single domain antibody fused to one or more anti-serum protein single domain antibody, the sequences of said heterospecific polypeptide corresponding to any of SEQ ID NOs: 5 to 18. The anti-TNF-alpha single domain antibodies  
5 therein are derived from *Camelidae* heavy chain antibodies (VHHs), which bind to TNF-alpha.

One embodiment of the present invention is a heterospecific polypeptide construct comprising one or more anti-TNF-alpha single domain antibodies fused to one or more anti-serum protein single domain antibodies for use in treating, preventing and/or alleviating the  
10 symptoms of inflammatory disorders. TNF-alpha is involved in inflammatory processes, and the blocking of TNF-alpha action can have an anti-inflammatory effect, which is highly desirable in certain disorder states such as, for example, Crohn's disease. Oral delivery of these heterospecific polypeptide construct results in the delivery of such molecules in an active form in the colon at sites that are affected by the disorder. These sites are highly  
15 inflamed and contain TNF-alpha producing cells. These heterospecific polypeptide constructs can neutralise the TNF-alpha locally, avoiding distribution throughout the whole body and thus limiting negative side-effects. Genetically modified microorganisms such as *Micrococcus lactis* are able to secrete antibody fragments. Such modified microorganisms can be used as vehicles for local production and delivery of antibody fragments in the intestine. By using a  
20 strain which produces a TNF-alpha-neutralising heterospecific polypeptide construct, inflammatory bowel disorder could be treated.

Another aspect of the invention is a heterospecific polypeptide construct comprising one or more anti-TNF-alpha single domain antibodies fused to one or more anti-serum protein single  
25 domain antibodies for use in the treatment, prevention and/or alleviation of disorders relating to inflammatory processes, wherein said heterospecific polypeptide construct is administered intravenously, orally, sublingually, topically, nasally, vaginally, rectally or by inhalation.

Another aspect of the invention is the use of a heterospecific polypeptide construct  
30 comprising one or more anti-TNF-alpha single domain antibodies fused to one or more anti-serum protein single domain antibodies for the preparation of a medicament for the treatment, prevention and/or alleviation of disorders relating to inflammatory processes, wherein said

heterospecific polypeptide construct is administered intravenously, orally, sublingually, topically, nasally, vaginally, rectally or by inhalation.

- Another aspect of the invention is a method of treating, preventing and/or alleviating disorders relating to inflammatory processes, comprising administering to a subject a heterospecific polypeptide construct comprising one or more anti-TNF-alpha single domain antibodies fused to one or more anti-serum protein single domain antibodies intravenously, orally, sublingually, topically, nasally, vaginally, rectally or by inhalation.
- 10 Another aspect of the invention is a heterospecific polypeptide construct comprising one or more anti-TNF-alpha single domain antibodies fused to one or more anti-serum protein single domain antibodies for use in the treatment, prevention and/or alleviation of disorders relating to inflammatory processes.
- 15 Another aspect of the invention is a heterospecific polypeptide construct comprising one or more anti-TNF-alpha single domain antibodies fused to one or more anti-serum protein single domain antibodies for the preparation of a medicament for the treatment, prevention and/or alleviation of disorders relating to inflammatory processes.
- 20 It is an aspect of the invention that the anti-TNF-alpha single domain antibodies of the present invention may be derived from VHHs of any class. For example, they may be derived from a class of VHHs with high homology to the human VH sequence, or may be derived from any of the other classes of VHHs, including the major class of VHH. These VHHs include the full length *Camelidae* VHHs, domains and may comprise a human Fc domain if effector functions are needed.
- 25

The above aspects and embodiments apply to a heterospecific polypeptide construct comprising one or more anti-TNF-alpha single domain antibodies fused to one or more anti-serum protein single domain antibodies, wherein said heterospecific polypeptide corresponds to a sequence represented by any of SEQ ID NOs: 5 to 18, a homologous sequence thereof, a functional portion thereof, of a homologous sequence of a functional portion thereof. SEQ ID NOs: 5 to 18 comprise anti-TNF alpha *Camelidae* VHH and anti-mouse serum albumin *Camelidae* VHH.

30

The above aspects and embodiments apply to a heterospecific polypeptide construct comprising one or more anti-TNF-alpha single domain antibodies fused to one or more anti-serum protein single domain antibodies wherein said anti-serum protein single domain antibodies correspond to any of SEQ ID NOs: 1 to 4 (anti-serum protein *Camelidae* VHHs), a homologous sequence thereof, a functional portion thereof, of a homologous sequence of a functional portion thereof.

The inventors have found that a heterospecific polypeptide construct comprising a sequence corresponding to any of SEQ ID NOs: 5 to 18 surprisingly exhibits higher than expected affinity towards its target and prolonged half-life in the circulatory system.

Platelet-mediated aggregation is the process wherein von Willebrand Factor (vWF)-bound collagen adheres to platelets and/or platelet receptors (examples of both are gpl $\alpha$ /IIa, gplb, or collagen), ultimately resulting in platelet activation. Platelet activation leads to fibrinogen binding, and finally to platelet aggregation. The ability to disrupt platelet-mediated aggregation has many applications including the treatment of disease as mentioned below. Since the heterospecific polypeptide constructs of the invention effectively prevent clotting, and the half-life thereof is controllable, they may be used for surgical procedures, for example, which require an inhibition of platelet-mediated aggregation for a limited time period.

Monovalent single domain antibodies such as VHHs show surprisingly high platelet aggregation inhibition in experiments to measure platelet aggregation inhibition under high shear: 50% inhibition of platelet aggregation was obtained at a concentration between 4 and 25 nM. In comparison, the Fab fragment derived from a vWF-specific antibody inhibiting the interaction with collagen, 82D6A3, inhibits 50% of platelet aggregation at approximately a twenty-fold higher concentration (Vanhoorelbeke K. et al, Journal of Biological Chemistry, 2003, 278: 37815-37821). These results were unexpected given that the IC<sub>50</sub> values for the monovalent VHH's are up to 225 times fold worse in ELISA than the IC<sub>50</sub> value of the IgG of 82D6A3.

This clearly shows that IgG antibodies are not suited to interaction with macromolecules which are starting, or are in the process of aggregating, such as those involved in platelet-mediated

aggregation. vWF makes multimers of up to 60 monomers (final multimers of up to 20 million dalton in size). Indeed, it has been shown that not all A3 domains are accessible to 82D6A3 (Dongmei WU, Blood, 2002, 99, 3623 to 3628). Furthermore the large size of conventional antibodies, would restrict tissue penetration, for example, during platelet-mediated aggregation at the site of a damaged vessel wall.

The structure of single domain antibodies, in particular is unique. For example VHH molecules derived from *Camelidae* antibodies are among the smallest intact antigen-binding domains known (approximately 15 kDa, or 10 times smaller than a conventional IgG) and hence are well suited towards delivery to dense tissues and for accessing the limited space between macromolecules participating in or starting the process of platelet mediated aggregation.

To our knowledge, this is the first time that experiments show, that the small size of a VHH is advantageous over a large intact antibody for inhibition of interactions between such large macromolecules.

Despite the small size of nanobodies, and thus advantages for penetration, it is still surprising that such a small molecule can inhibit interactions between large polymers such as vWF (up to 60 monomers) and collagen and with such a high efficiency. It has been described that only the large multimeric forms of vWF are hemostatically active (Furlan, M., 1996, *Ann. Hematol.* 72:341-348). Binding of multimeric vWF to collagen occurs with ~100-fold higher affinity than binding of monomeric vWF fragments.

The results from the high shear experiments indicate that a lower dose will be needed for administration to patients. Therefore, fewer side effects are expected (such as immunogenicity or bleeding problems).

It is an aspect of the present invention to provide heterospecific polypeptide constructs which modulate processes which comprise platelet-mediated aggregation such as, for example, vWF-collagen binding, vWF-platelet receptor adhesion, collagen-platelet receptor adhesion, platelet activation, fibrinogen binding and/or platelet aggregation. Said heterospecific

polypeptide constructs are derived from single domain antibodies directed towards vWF, vWF A1 or A3 domains, gplb or collagen.

5 Anti-target single domain antibodies may be directed against whole vWF, vWF A1 or A3 domains, gplb or collagen or a fragment thereof, or a fragment of a homologous sequence thereof.

10 According to one aspect of the invention, a target against which a heterospecific polypeptide construct comprising one or more anti-target single domain antibodies fused to one or more anti-serum protein single domain antibodies is directed is von Willebrand factor (vWF). According to another aspect of the invention, the target is vWF A1 or A3 domains. According to another aspect of the invention, the target is gplb. According to another aspect of the invention, the target is gplb/IIA. According to another aspect of the invention, the target is collagen.

15 One aspect of the present invention relates to a heterospecific polypeptide construct comprising one or more anti-vWF single domain antibodies fused to one or more anti-serum protein VHs, the sequences of said heterospecific polypeptide corresponding to any of SEQ ID NOs: 19 to 21. The anti-vWF single domain antibodies therein are derived from *Camelidae* heavy chain antibodies (VHs), which bind to vWF.

25 One embodiment of the present invention is a heterospecific polypeptide construct comprising one or more anti-target single domain antibodies fused to one or more anti-serum protein single domain antibodies target, wherein the target is any of vWF, vWF A1 or A3 domains, gplb or collagen for use in treating, preventing and/or alleviating the symptoms of disorders or conditions relating to platelet-mediated aggregation or dysfunction thereof. Said disorders include transient cerebral ischemic attack, unstable angina pectoris, cerebral infarction, myocardial infarction, peripheral arterial occlusive disease, restenosis. Said conditions include those arising from coronary by-pass graft, coronary artery valve replacement and coronary interventions such angioplasty, stenting, or atherectomy.

30 One aspect of the invention is a heterospecific polypeptide construct comprising one or more anti-target single domain antibodies fused to one or more anti-serum protein single domain

antibodies, wherein the target is any of vWF, vWF A1 or A3 domains or collagen for use in the treatment, prevention and/or alleviation of disorders or conditions relating to platelet-mediated aggregation or dysfunction thereof, wherein said heterospecific polypeptide construct is administered intravenously, orally, sublingually, topically, nasally, vaginally, rectally or by inhalation.

Another aspect of the invention is the use of a heterospecific polypeptide construct comprising one or more anti-target single domain antibodies fused to one or more anti-serum protein single domain antibodies target, wherein the target is any of vWF, vWF A1 or A3 domains or collagen for the preparation of a medicament for the treatment, prevention and/or alleviation of disorders or conditions relating to platelet-mediated aggregation or dysfunction thereof, wherein said heterospecific polypeptide construct is administered intravenously, orally, sublingually, topically, nasally, vaginally, rectally or by inhalation.

Another aspect of the invention is a method of treating, preventing and/or alleviating disorders or conditions relating to relating to platelet-mediated aggregation or dysfunction thereof, comprising administering to a subject a heterospecific polypeptide construct comprising one or more anti-target single domain antibodies fused to one or more anti-serum protein single domain antibodies target, wherein the target is any of vWF, vWF A1 or A3 domains or collagen, wherein said heterospecific polypeptide construct is administered intravenously, orally, sublingually, topically, nasally, vaginally, rectally or by inhalation.

Another aspect of the invention is a heterospecific polypeptide construct comprising one or more anti-target single domain antibodies fused to one or more anti-serum protein single domain antibodies, wherein the target is any of vWF, vWF A1 or A3 domains or collagen for use in the treatment, prevention and/or alleviation of disorders or conditions relating to platelet-mediated aggregation or dysfunction thereof.

Another aspect of the invention is a use of a heterospecific polypeptide construct comprising one or more anti-target single domain antibodies fused to one or more anti-serum protein single domain antibodies, wherein the target is any of vWF, vWF A1 or A3 domains or collagen for the preparation of a medicament for the treatment, prevention and/or alleviation of disorders or conditions relating to platelet-mediated aggregation or dysfunction thereof.

It is an aspect of the invention that the anti-vWF, anti-vWF A1 or anti-vWF A3 or anti-collagen VHHs of the present invention may be derived from VHHs of any class. For example, they may be derived from the class of VHHs with high homology to the human VH sequence, or  
5 may be derived from any of the other classes of VHHs, including the major class of VHH. These VHHs include the full length *Camelidae* VHHs, domains and may comprise a human Fc domain if effector functions are needed.

The above aspects and embodiments apply to a heterospecific polypeptide construct  
10 comprising one or more anti-vWF single domain antibodies wherein said heterospecific polypeptide corresponds to a sequence represented by any of SEQ ID NOs: 19 to 21, a homologous sequence thereof, a functional portion thereof, of a homologous sequence of a functional portion thereof. SEQ ID NOs: 19 to 21 comprise anti-vWF VHH and anti-mouse serum albumin VHH.

15 The above aspects and embodiments apply to a heterospecific polypeptide construct comprising one or more anti-target single domain antibodies fused to one or more anti-serum protein single domain antibodies, wherein the target is any of vWF, vWF A1 or A3 domains, gp1b or collagen and wherein said anti-serum protein single domain antibodies correspond to  
20 any of SEQ ID NOs: 1 to 4, a homologous sequence thereof, a functional portion thereof, of a homologous sequence of a functional portion thereof.

During their lifetime, subjects may develop an allergic response to harmless parasites (e.g. *Dermatophagoides pteronyssinus*, house dust mite) or substances (clumps, plastics, metals).  
25 This results in the induction of IgE molecules that initiate a cascade of immunological responses. One aspect of the present invention is a heterospecific polypeptide construct comprising one or more anti-IgE single domain antibodies, said heterospecific polypeptide construct preventing the interaction of IgEs with their receptor(s) on mast cells and basophils. As such they prevent the initiation of the immunological cascade, an allergic reaction.

30 According to one aspect of the invention, a target against which a heterospecific polypeptide construct comprising one or more anti-target single domain antibodies fused to one or more anti-serum protein single domain antibodies is directed is IgE. Said antibodies may be

directed against whole IgE or a fragment thereof, or a fragment of a homologous sequence thereof.

One aspect of the present invention relates to a heterospecific polypeptide construct comprising one or more anti-IgE single domain antibodies fused to one or more anti-serum protein single domain antibodies, wherein the sequences of said heterospecific polypeptide corresponding to any of SEQ ID NOs: 22 to 24. The anti-IgE single domain antibodies therein are derived from *Camelidae* heavy chain antibodies (VHHs), which bind to IgE.

Anti-target single domain antibodies may be directed against whole IgE-alpha or a fragment thereof, or a fragment of a homologous sequence thereof.

One embodiment of the present invention is a heterospecific polypeptide construct comprising one or more anti-IgE single domain antibody fused to one or more anti-serum protein single domain antibodies for use in treating, preventing and/or alleviating the symptoms of disorders relating to allergies. Said disorders comprise a wide range of IgE-mediated diseases such as hay fever, asthma, atopic dermatitis, allergic skin reactions, allergic eye reactions and food allergies.

One aspect of the invention is a heterospecific polypeptide construct comprising one or more anti-IgE single domain antibodies fused to one or more anti-serum protein single domain antibodies for use in the treatment, prevention and/or alleviation of disorders relating to allergies, wherein said VHH is administered intravenously, orally, sublingually, topically, nasally, vaginally, rectally or by inhalation.

25

Another aspect of the invention is the use of a heterospecific polypeptide construct comprising one or more anti-IgE single domain antibodies fused to one or more anti-serum protein single domain antibodies for the preparation of a medicament for the treatment, prevention and/or alleviation of disorders relating to allergies, wherein said heterospecific polypeptide construct is administered intravenously, orally, sublingually, topically, nasally, vaginally, rectally or by inhalation.

30

Another aspect of the invention is a method of treating, preventing and/or alleviating disorders relating to allergies, comprising administering to a subject a heterospecific polypeptide construct comprising one or more anti-IgE single domain antibodies fused to one or more anti-serum protein single domain antibodies intravenously, orally, sublingually, topically,  
5 nasally, vaginally, rectally or by inhalation.

Another aspect of the invention is a heterospecific polypeptide construct comprising one or more anti-IgE single domain antibodies fused to one or more anti-serum protein single domain antibodies for use in the preparation of a medicament for the treatment, prevention  
10 and/or alleviation of disorders relating to allergies.

Another aspect of the invention is a use of a heterospecific polypeptide construct comprising one or more anti-IgE single domain antibodies fused to one or more anti-serum protein single domain antibodies for the preparation of a medicament for the treatment, prevention and/or  
15 alleviation of disorders relating to allergies.

It is an aspect of the invention that the anti-IgE single domain antibodies of the present invention may be derived from VHHs of any class. For example, they may be derived from a class of VHHs with high homology to the human VH sequence, or may be derived from any of  
20 the other classes of VHHs, including the major class of VHH. Said VHHs may be derived from *Camelidae*. These VHHs include the full length *Camelidae* VHHs, domains and may comprise a human Fc domain if effector functions are needed.

The above aspects and embodiments apply to a heterospecific polypeptide construct comprising one or more anti-IgE single domain antibodies fused to one or more anti-serum protein single domain antibodies, wherein the heterospecific polypeptides correspond to a  
25 sequence represented by any of SEQ ID NOs: 22 to 24, a homologous sequence thereof, a functional portion thereof, of a homologous sequence of a functional portion thereof. SEQ ID NOs: 22 to 24 comprise anti-IgE *Camelidae* VHH and anti-mouse serum albumin *Camelidae*  
30 VHH.

The above aspects and embodiments apply to a heterospecific polypeptide construct comprising one or more anti-IgE single domain antibodies fused to one or more anti-serum

protein single domain antibodies wherein said anti-serum protein single domain antibodies correspond to any of SEQ ID NOs: 1 to 4 (anti-protein serum *Camelidae* VHHs), a homologous sequence thereof, a functional portion thereof, of a homologous sequence of a functional portion thereof.

5

A heterospecific polypeptide construct as disclosed herein prevents thus reduces or prevents an allergic response due to common or unusual allergens. Furthermore, the construct has a prolonged lifetime in the blood so increasing the therapeutic window.

- 10 Interferon gamma (IFN-gamma) is believed to play an important role in various disorders, for example in inflammatory disorders such as rheumatoid arthritis, Crohn's disease, inflammatory bowel disease, ulcerative colitis, multiple sclerosis and hyperimmune reactions in the eye. IFN-gamma has also been shown to play a significant role in the pathology of autoimmune diseases. For example, the presence of IFN-gamma has been implicated in
- 15 rheumatoid arthritis (Brennan et al, Brit. J. Rheum., 31, 293-8 (1992)) . Several strategies to antagonize the action of these cytokines have been developed and are currently used to treat various disease states.

- IFN-gamma in its bioactive form is a dimer and the groove formed by the two subunits is
- 20 important for its biological activity through interaction with the IFN-gamma receptor. An IFN-gamma inhibitor which has sufficient specificity and selectivity to IFN-gamma may be an efficient prophylactic or therapeutic pharmaceutical compound for preventing or treating inflammatory disorders. Diseases associated with IFN-gamma include multiple sclerosis, rheumatoid arthritis, ankylosing spondylitis, juvenile rheumatoid arthritis, and psoriatic arthritis
- 25 (US6,333,032 Advanced Biotherapy Concepts, Inc.). Other diseases include Crohn's disease and psoriasis (US6,329,511 Protein Design Labs). Yet other diseases are bowel disease, ulcerative colitis and Crohn's disease (EP0695189 Genentech).

- None of the presently available drugs are completely effective for the treatment of
- 30 autoimmune disease, and most are limited by severe toxicity. In addition, it is extremely difficult and a lengthy process to develop a new chemical entity (NCE) with sufficient potency and selectivity to such target sequence. Antibody-based therapeutics on the other hand have significant potential as drugs because they have exquisite specificity to their target and a low

inherent toxicity. In addition, the development time can be reduced considerably when compared to the development of new chemical entities (NCE's). However, conventional antibodies are difficult to raise against multimeric proteins where the receptor-binding domain of the ligand is embedded in a groove, as is the case with IFN-gamma.

5

The heterospecific polypeptide constructs of the present invention, wherein the anti-target single domain antibody is directed against TNF-alpha overcome the problems experienced using peptide therapeutics of the art because of the properties thereof such as stability, size, and reliable expression. Furthermore, the inventors have found that, despite presence of a groove in multimeric IFN-gamma, the heterospecific polypeptide constructs are still able to achieve strong binding to IFN-gamma.

According to one aspect of the invention, a target against which one or more anti-target single domain antibodies of a heterospecific polypeptide construct comprising one or more anti-target single domain antibodies fused to one or more anti-serum protein single domain antibodies is directed is interferon-gamma (IFN-gamma). IFN-gamma is secreted by some T cells. In addition to its anti-viral activity, IFN-gamma stimulates natural killer (NK) cells and T helper 1 (Th1) cells, and activates macrophages and stimulates the expression of MHC molecules on the surface of cells. Hence, IFN-gamma generally serves to enhance many aspects of immune function, and is a candidate for treatment of disorders where the immune system is over-active e.g. Crohn's disease, autoimmune disorders and organ plant rejection in addition inflammatory disorders such as rheumatoid arthritis, Crohn's disease, ulcerative colitis and multiple sclerosis.

One aspect of the present invention relates to a heterospecific polypeptide construct comprising one or more anti-IFN-gamma single domain antibodies fused to one or more anti-serum protein single domain antibodies, the sequences of said heterospecific polypeptide corresponding to any of SEQ ID NOs: 25 to 27. The anti-IFN-gamma single domain antibodies therein are derived from *Camelidae* heavy chain antibodies (VHHs), which bind to IFN-gamma.

Anti-target single domain antibodies may be directed against whole IFN-gamma or a fragment thereof, or a fragment of a homologous sequence thereof.

One embodiment of the present invention is a heterospecific polypeptide construct comprising one or more anti-IFN-gamma single domain antibodies fused to one or more anti-serum protein single domain antibodies for use in treating, preventing and/or alleviating the symptoms of the disorders wherein the immune system is overactive, as mentioned above.

- 5 Current therapy consists of intravenous administration of anti-IFN-gamma antibodies. Oral delivery of these heterospecific polypeptide constructs results in the delivery of such molecules in an active form in the colon at sites that are affected by the disorder. These sites are highly inflamed and contain IFN-gamma producing cells. These heterospecific polypeptide constructs can neutralise the IFN-gamma locally, avoiding distribution throughout
- 10 the whole body and thus limiting negative side-effects. Genetically modified microorganisms such as *Micrococcus lactis* are able to secrete antibody fragments. Such modified microorganisms can be used as vehicles for local production and delivery of antibody fragments in the intestine. By using a strain which produces a IFN-gamma neutralising heterospecific polypeptide construct, inflammatory bowel disorder could be treated.

- 15 Another aspect of the invention is a heterospecific polypeptide construct comprising one or more anti-IFN-gamma single domain antibodies fused to one or more anti-serum protein single domain antibodies for use in the treatment, prevention and/or alleviation of disorders wherein the immune system is overactive, wherein said heterospecific polypeptide construct
- 20 is administered intravenously, orally, sublingually, topically, nasally, vaginally, rectally or by inhalation.

- Another aspect of the invention is the use of a heterospecific polypeptide construct comprising one or more anti-IFN-gamma single domain antibodies fused to one or more anti-
- 25 serum protein single domain antibodies for the preparation of a medicament for the treatment, prevention and/or alleviation of disorders wherein the immune system is over active, wherein said heterospecific polypeptide construct is administered intravenously, orally, sublingually, topically, nasally, vaginally, rectally or by inhalation.

- 30 Another aspect of the invention is a method of treating, preventing and/or alleviating disorders wherein the immune system is overactive, comprising administering to a subject a heterospecific polypeptide construct comprising one or more anti-IFN-gamma single domain

antibodies fused to one or more anti-serum protein single domain antibodies intravenously, orally, sublingually, topically, nasally, vaginally, rectally or by inhalation.

Another aspect of the invention is a heterospecific polypeptide construct comprising one or  
5 more anti-IFN-gamma single domain antibodies joined to one or more anti-serum protein single domain antibodies for use in the preparation of a medicament for the treatment, prevention and/or alleviation of disorders wherein the immune system is overactive.

Another aspect of the invention is a use of a heterospecific polypeptide construct comprising  
10 one or more anti-IFN-gamma single domain antibodies fused to one or more anti-serum protein single domain antibodies for use in the preparation of a medicament for the treatment, prevention and/or alleviation of disorders wherein the immune system is over active.

It is an aspect of the invention that the anti-IFN-gamma single domain antibodies of the  
15 present invention may be derived from VHHs of any class. For example, they may be derived from a class of VHHs with high homology to the human VH sequence, or may be derived from any of the other classes of VHHs, including the major class of VHH. These VHHs include the full length *Camelidae* VHHs, domains and may comprise a human Fc domain if effector functions are needed.

20 The above aspect and embodiments apply to a heterospecific polypeptide construct comprising one or more anti-IFN-gamma VHHs fused to one or more anti-serum protein single domain antibodies wherein said heterospecific polypeptide corresponds to a sequence represented by any of SEQ ID NOs: 25 to 27, a homologous sequence thereof, a functional  
25 portion thereof, of a homologous sequence of a functional portion. SEQ ID NOs: 25 to 27 comprise anti-IFN-gamma VHH and anti-mouse serum albumin VHH.

The above aspects and embodiments apply to a heterospecific polypeptide construct comprising one or more anti-IFN-gamma single domain antibodies fused to one or more anti-  
30 serum protein VHHs wherein said anti-serum protein VHHs correspond to any of SEQ ID NOs: 1 to 4, a homologous sequence thereof, a functional portion thereof, of a homologous sequence of a functional portion thereof.

One embodiment of the present invention is a recombinant clone comprising nucleic acid encoding a heterospecific polypeptide construct according to the invention. In one aspect of the invention, said nucleic acid encodes one or more single domain antibodies each directed to a therapeutic or diagnostic target antigen and one or more single domain antibodies  
5 directed to a serum protein, said single domain antibodies linked without intervening linkers, or with one or more peptide linker sequences. According to one aspect of the invention, a linker sequence is any suitable linker sequence known in the art. According to another aspect of the invention, a linker sequence is a naturally occurring sequence. Preferred properties of linkers sequences are that they are not immunogenic or not significantly immunogenic, they  
10 can provide sufficient flexibility to the heterospecific polypeptide construct, and are resistant to proteolytic degradation. An example of a linker according to the invention is that disclosed in PCT/EP96/01725 which is derived from the hinge region of VHH.

According to another aspect of the invention, a clone comprises nucleic acid encoding a  
15 polypeptide corresponding to a sequence represented by any of SEQ ID NOs: 1 to 4, a homologous sequence thereof, a functional portion thereof, or a homologous sequence of a functional portion, and nucleic acid encoding one or more anti-target single domain antibodies, a homologous sequence thereof, a functional portion thereof, or a homologous sequence of a functional portion thereof.

20

According to another aspect of the invention, a clone comprises nucleic acid capable of encoding a polypeptide corresponding to a sequence represented by any of SEQ ID NOs:5 to 27, a homologous sequence thereof, a functional portion thereof, or a homologous sequence of a functional portion thereof.

25

It is within the scope of the invention that nucleic acid encoding multiple anti-target and/or multiple anti-serum VHHs are present in a clone of the invention.

By transforming a compatible host with a clone encoding a heterospecific polypeptide  
30 construct of the invention, the heterospecific polypeptide construct can be produced in sufficient quantities for use in therapy. Examples of organisms into which said clone may be transformed include, but are not limited to *E. coli* or *Saccharomyces cerevisiae*.

Another embodiment of the present invention is a method for prolonging the half-life of an anti-target-VHH comprising the step of joining thereto one or more anti-serum albumin single domain antibodies. As already mentioned above, methods for joining are known in the art or may be any future method, for example, they may be fused by chemical coupling, fused at the DNA level etc.

Treating, preventing and/or alleviating the symptoms of one or more of the disorders mentioned herein generally involves administering to a subject a "therapeutically effective amount" of heterospecific polypeptide construct. By "therapeutically effective amount", "therapeutically effective dose" and "effective amount" means the amount needed to achieve the desired result or results. One of ordinary skill in the art will recognise that the potency and, therefore, an "effective amount" can vary for the various compounds that inhibit a disorder pathway used in the invention. One skilled in the art can readily assess the potency of the compound.

As used herein, the term "compound" refers to a heterospecific polypeptide construct as disclosed herein, a polypeptide represented by SEQ ID NOs: 5 to 27, a homologous sequence thereof, or a homologue thereof, or a nucleic acid capable of encoding said polypeptide.

By "pharmaceutically acceptable" is meant a material that is not biologically or otherwise undesirable, *i.e.*, the material may be administered to an individual along with the compound without causing any undesirable biological effects or interacting in a deleterious manner with any of the other components of the pharmaceutical composition in which it is contained.

The invention disclosed herein is useful for treating or preventing a condition relating to a disorder as mentioned herein (*e.g.* allergy and/or inflammation), in a subject and comprising administering a pharmaceutically effective amount of a compound or composition that binds to a component involved in the disorder pathway (*e.g.* to IgE and/or TNF-alpha in the blood stream), so inhibiting the disorder pathway and the disorder.

One aspect of the present invention is the use of compounds of the invention for treating or preventing a condition relating to a disorder as mentioned herein (*e.g.* allergy and/or

inflammation), in a subject and comprising administering a pharmaceutically effective amount of a compound in combination with another, such as, for example, aspirin.

5 The present invention is not limited to the administration of formulations comprising a single compound of the invention. It is within the scope of the invention to provide combination treatments wherein a formulation is administered to a patient in need thereof that comprises more than one compound of the invention.

10 It is well known in the art how to determine the inhibition of a disorder pathway using the standard tests described herein, or using other similar tests. Preferably, the method would result in at least a 10% reduction in an indicator of the disorder, including, for example, 15%, 20%, 25%, 30%, 40%, 50%, 60%, 70%, 80%, 90%, 100%, or any amount in between, more preferably by 90%. For example, an inhibition of an allergic pathway by inhibition of IgE by a peptide of the invention might result in a 10% reduction in food-specific IgE levels.

15 The compound useful in the present invention can be formulated as pharmaceutical compositions and administered to a mammalian host, such as a human patient or any animal in a variety of forms adapted to the chosen route of administration, *i.e.*, orally or parenterally, by intranasally by inhalation, intravenous, intramuscular, topical or subcutaneous routes.

20 The compound of the present invention can also be administered using gene therapy methods of delivery. See, *e.g.*, U.S. Patent No. 5,399,346, which is incorporated by reference in its entirety. Using a gene therapy method of delivery, primary cells transfected with the gene for the compound of the present invention can additionally be transfected with tissue specific promoters to target specific organs, tissue, grafts, tumors, or cells.

25 Thus, the present compound may be systemically administered, *e.g.*, orally, in combination with a pharmaceutically acceptable vehicle such as an inert diluent or an assimilable edible carrier. They may be enclosed in hard or soft shell gelatin capsules, may be compressed into tablets, or may be incorporated directly with the food of the patient's diet. For oral therapeutic administration, the active compound may be combined with one or more excipients and used in the form of ingestible tablets, buccal tablets, troches, capsules, elixirs, suspensions, syrups, wafers, and the like. Such compositions and preparations should contain at least

0.1% of active compound. The percentage of the compositions and preparations may, of course, be varied and may conveniently be between about 2 to about 60% of the weight of a given unit dosage form. The amount of active compound in such therapeutically useful compositions is such that an effective dosage level will be obtained.

5

The tablets, troches, pills, capsules, and the like may also contain the following: binders such as gum tragacanth, acacia, corn starch or gelatin; excipients such as dicalcium phosphate; a disintegrating agent such as corn starch, potato starch, alginic acid and the like; a lubricant such as magnesium stearate; and a sweetening agent such as sucrose, fructose, lactose or aspartame or a flavoring agent such as peppermint, oil of wintergreen, or cherry flavoring may be added. When the unit dosage form is a capsule, it may contain, in addition to materials of the above type, a liquid carrier, such as a vegetable oil or a polyethylene glycol. Various other materials may be present as coatings or to otherwise modify the physical form of the solid unit dosage form. For instance, tablets, pills, or capsules may be coated with gelatin, wax, shellac or sugar and the like. A syrup or elixir may contain the active compound, sucrose or fructose as a sweetening agent, methyl and propylparabens as preservatives, a dye and flavoring such as cherry or orange flavor. Of course, any material used in preparing any unit dosage form should be pharmaceutically acceptable and substantially non-toxic in the amounts employed. In addition, the active compound may be incorporated into sustained-release preparations and devices.

The active compound may also be administered intravenously or intraperitoneally by infusion or injection. Solutions of the active compound or its salts can be prepared in water, optionally mixed with a nontoxic surfactant. Dispersions can also be prepared in glycerol, liquid polyethylene glycols, triacetin, and mixtures thereof and in oils. Under ordinary conditions of storage and use, these preparations contain a preservative to prevent the growth of microorganisms.

The pharmaceutical dosage forms suitable for injection or infusion can include sterile aqueous solutions or dispersions or sterile powders comprising the active ingredient which are adapted for the extemporaneous preparation of sterile injectable or infusible solutions or dispersions, optionally encapsulated in liposomes. In all cases, the ultimate dosage form must be sterile, fluid and stable under the conditions of manufacture and storage. The liquid

carrier or vehicle can be a solvent or liquid dispersion medium comprising, for example, water, ethanol, a polyol (for example, glycerol, propylene glycol, liquid polyethylene glycols, and the like), vegetable oils, nontoxic glyceryl esters, and suitable mixtures thereof. The proper fluidity can be maintained, for example, by the formation of liposomes, by the maintenance of the required particle size in the case of dispersions or by the use of surfactants. The prevention of the action of microorganisms can be brought about by various antibacterial and antifungal agents, for example, parabens, chlorobutanol, phenol, sorbic acid, thimerosal, and the like. In many cases, it will be preferable to include isotonic agents, for example, sugars, buffers or sodium chloride. Prolonged absorption of the injectable compositions can be brought about by the use in the compositions of agents delaying absorption, for example, aluminum monostearate and gelatin.

Sterile injectable solutions are prepared by incorporating the active compound in the required amount in the appropriate solvent with various of the other ingredients enumerated above, as required, followed by filter sterilization. In the case of sterile powders for the preparation of sterile injectable solutions, the preferred methods of preparation are vacuum drying and the freeze drying techniques, which yield a powder of the active ingredient plus any additional desired ingredient present in the previously sterile-filtered solutions.

For topical administration, the present compound may be applied in pure form, i.e., when they are liquids. However, it will generally be desirable to administer them to the skin as compositions or formulations, in combination with a dermatologically acceptable carrier, which may be a solid or a liquid.

Useful solid carriers include finely divided solids such as talc, clay, microcrystalline cellulose, silica, alumina and the like. Useful liquid carriers include water, hydroxyalkyls or glycols or water-alcohol/glycol blends, in which the present compound can be dissolved or dispersed at effective levels, optionally with the aid of non-toxic surfactants. Adjuvants such as fragrances and additional antimicrobial agents can be added to optimize the properties for a given use. The resultant liquid compositions can be applied from absorbent pads, used to impregnate bandages and other dressings, or sprayed onto the affected area using pump-type or aerosol sprayers.

Thickeners such as synthetic polymers, fatty acids, fatty acid salts and esters, fatty alcohols, modified celluloses or modified mineral materials can also be employed with liquid carriers to form spreadable pastes, gels, ointments, soaps, and the like, for application directly to the skin of the user.

5

Examples of useful dermatological compositions which can be used to deliver the compound to the skin are known to the art; for example, see Jacquet et al. (U.S. Pat. No. 4,608,392), Geria (U.S. Pat. No. 4,992,478), Smith et al. (U.S. Pat. No. 4,559,157) and Wortzman (U.S. Pat. No. 4,820,508).

10

Useful dosages of the compound can be determined by comparing their *in vitro* activity, and *in vivo* activity in animal models. Methods for the extrapolation of effective dosages in mice, and other animals, to humans are known to the art; for example, see U.S. Pat. No. 4,938,949.

15

Generally, the concentration of the compound(s) in a liquid composition, such as a lotion, will be from about 0.1-25 wt-%, preferably from about 0.5-10 wt-%. The concentration in a semi-solid or solid composition such as a gel or a powder will be about 0.1-5 wt-%, preferably about 0.5-2.5 wt-%.

20

The amount of the compound, or an active salt or derivative thereof, required for use in treatment will vary not only with the particular salt selected but also with the route of administration, the nature of the condition being treated and the age and condition of the patient and will be ultimately at the discretion of the attendant physician or clinician. Also the dosage of the compound varies depending on the target cell, tumor, tissue, graft, or organ.

25

The desired dose may conveniently be presented in a single dose or as divided doses administered at appropriate intervals, for example, as two, three, four or more sub-doses per day. The sub-dose itself may be further divided, *e.g.*, into a number of discrete loosely spaced administrations; such as multiple inhalations from an insufflator or by application of a

30

plurality of drops into the eye.

An administration regimen could include long-term, daily treatment. By "long-term" is meant at least two weeks and preferably, several weeks, months, or years of duration. Necessary

modifications in this dosage range may be determined by one of ordinary skill in the art using only routine experimentation given the teachings herein. See Remington's Pharmaceutical Sciences (Martin, E.W., ed. 4), Mack Publishing Co., Easton, PA. The dosage can also be adjusted by the individual physician in the event of any complication.

5

## EXAMPLES

### Example 1: Immunization of llamas

One llama was immunized with human serum albumin (HSA). The immunization scheme is summarized in Table 1.

10

### Example 2: Repertoire cloning

Peripheral blood lymphocytes (PBLs) were isolated by centrifugation on a density gradient (Ficoll-Paque Plus Amersham Biosciences). PBLs were used to extract total RNA (Chomczynski and Sacchi 1987). cDNA was prepared on 100 µg total RNA with MMLV Reverse Transcriptase (Gibco BRL) using oligo d(T) oligonucleotides. The cDNA was purified with a phenol/chloroform extraction, followed by an ethanol precipitation and subsequently used as template to amplify the VHH repertoire.

15

In a first PCR, the repertoire of both conventional (1.6 kb) and heavy-chain (1.3 kb) antibody gene segments were amplified using a leader specific primer (5' - GGCTGAGCTCGGTGGTCCTGGCT- 3') and the oligo d(T) primer (5'- AACTGGAAGAATTTCGCGGCCGCAGGAATTTTTTTTTTTTTTTTTT-3'). The resulting DNA fragments were separated by agarose gel electrophoresis and the 1.3 kb fragment, encoding heavy-chain antibody segments was purified from the agarose gel. A second PCR was performed using a mixture of FR1 reverse primers and the same oligo d(T) forward primer. The PCR products were digested with *Sfi*I (introduced in the FR1 primer) and *Bst*EII (naturally occurring in FR4). Following gel electrophoresis, the DNA fragment of approximately 400 basepairs were purified from gel and ligated into the corresponding restriction sites of phagemid pAX004 to obtain a library of cloned VHHs after electroporation of *Escherichia coli* TG1. The size of the library was  $1.4 \times 10^7$  cfu, and all clones contained insert of the correct size.

20

25

30

**Example 3: Rescue of the library, phage preparation**

The library was grown at 37°C in 10 ml 2xTY medium containing 2% glucose, and 100 µg/ml ampicillin, until the OD<sub>600nm</sub> reached 0.5. M13KO7 phages (10<sup>12</sup>) were added and the mixture was incubated at 37°C for 2 x 30 minutes, first without shaking, then with shaking at 100 rpm. Cells were centrifuged for 10 minutes at 4500 rpm at room temperature. The bacterial pellet was resuspended in 50 ml of 2xTY medium containing 100 µg/ml ampicillin and 25 µg/ml kanamycin, and incubated overnight at 37°C with vigorously shaking at 250 rpm. The overnight cultures were centrifuged for 15 minutes at 10,000 rpm at 4°C. Phages were PEG precipitated (20% poly-ethylene-glycol and 1.5 M NaCl) and centrifuged for 30 minutes at 10,000 rpm. The pellet was resuspended in 20 ml PBS. Phages were again PEG precipitated and centrifuged for 30 minutes at 20,000 rpm and 4°C. The pellet was dissolved in 5 ml PBS-1% casein. Phages were titrated by infection of TG1 cells at OD<sub>600nm</sub>= 0.5 and plating on LB agar plates containing 100 µg/ml ampicillin and 2% glucose. The number of transformants indicates the number of phages (= pfu). The phages were stored at -80°C with 15% glycerol.

**Example 4: Phage ELISA**

A microtiter plate (Maxisorp) was coated overnight at 4°C with PBS-1% casein or with 5 µg/ml HSA (human serum albumin). The plate was washed 3 times with PBS-Tween (0.05% Tween20) and blocked for 2 hours at room temperature with 200 µl PBS-1% casein. The plate was washed five times with PBS-Tween. Phages were prepared as described above and applied to the wells in consecutive twofold dilutions. Plates were washed five times with PBS-Tween. Bound phage were detected with a mouse monoclonal antibody anti-M13 conjugated with horse radish peroxidase (HRP) diluted 1/2000 in PBS. The plates were washed five times with PBS-Tween. Staining was performed with ABTS/H<sub>2</sub>O<sub>2</sub> and signals were measured after 30 minutes at 405 nm. Results are shown in Figure 1 and indicate the presence of HSA-specific nanobodies in the library.

**Example 5: Selection: first and second round of biopanning**

A well in a microtiterplate was coated with 10 µg/ml mouse serum albumin (MSA), or with PBS containing 1% casein. After overnight incubation at 4°C, the wells were blocked with PBS containing 1% casein, for 3 hours at room temperature (RT). 200 µl phages was added to the wells. After 2 hours incubation at RT, the wells were washed 10x with PBS-Tween and

10x with PBS. Bound phages were eluted with 100 µl 0.2 M glycine buffer pH= 2.4. Elutions were performed for 20 minutes at room temperature. Eluted phages were allowed to infect exponentially growing *E. Coli* TG1 cells, and were then plated on LB agar plates containing 100 µg/ml ampicillin and 2% glucose. A second round was performed with the same conditions as described above. Results are summarized in Table 2.

#### **Example 6: Screening of individual clones after biopanning**

##### ELISA: binding to human serum albumin (HSA) and mouse serum albumin (MSA)

A single colony was used to start an overnight culture in LB containing 2% glucose and 100 µg/ml ampicillin. This overnight culture was diluted 100-fold in TB medium containing 100 µg/ml ampicillin, and incubated at 37°C until OD<sub>600nm</sub>= 0.5. 1 mM IPTG was added and the culture was incubated for 3 more hours at 37°C or overnight at 28°C. Cultures were centrifuged for 20 minutes at 10,000 rpm at 4°C. The pellet was frozen overnight or for 1 hour at -20°C. Next, the pellet was thawed at room temperature for 40 minutes, re-suspended in PBS and shaken on ice for 1 hour. Periplasmic fraction was isolated by centrifugation for 20 minutes at 4°C at 20,000 rpm. The supernatant containing the VHH was used for further analysis.

A microtiter plate was coated with 5 µg/ml HSA, with 5 µg/ml mouse serum albumin (MSA) or with PBS-1% casein, overnight at 4°C. Plates were blocked for two hours at room temperature with 300 µl 1% casein in PBS. The plates were washed three times with PBS-Tween. Periplasmic fraction was prepared for 23 individual clones after the first and second round of selection, and allowed to bind to the wells of the microtiterplate. Plates were washed six times with PBS-Tween, after which binding of nanobody was detected by incubation with mouse anti-Histidine monoclonal antibody Serotec MCA 1396 (1/1000 dilution) in PBS for 1 hour at RT followed by anti-mouse-alkaline phosphatase conjugate 1/2000 in PBS, also for 1 hour at RT. Staining was performed with the substrate PNPP (p-nitrophenyl-phosphate, 2 mg/ml in 1M diethanolamine, 1mM Mg<sub>2</sub>SO<sub>4</sub>, pH9.8) and the signals were measured after 30 minutes at 405 nm. Results are summarized in Table 3.

#### **Example 7: HinfI pattern and sequencing**

A PCR was performed on positive clones after the second round of panning, with a set of primers binding to a sequence in the vector. The PCR product was digested with the restriction enzyme HinfI and loaded on a agarose gel. 4 clones were selected with a different

Hinfl-pattern for further evaluation. Those clones were sequenced, and results are summarized in Table 4 (SEQ ID NOS: 1, 2, 3 and 4).

**Example 8: Test cross-reactivity with albumin of different species**

5 A SDS-PAGE was run for plasma (1/10 dilution) from different species (baboon, pig, hamster, human, rat, mouse and rabbit) and blotted on a nitrocellulose membrane. Phages were prepared for clones MSA 21, MSA 24, MSA 210, MSA212 and a control nanobody as described in Example 3. Phages were allowed to bind to the nitrocellulose blotted serum albumins and unbound phages were washed away. Binding was detected with an anti-M13  
10 polyclonal antibody coupled to HRP. DAP was used as a substrate for detection. Results are shown in Figure 2.

From these results we can conclude that all 4 binders are cross-reactive between pig, human, mouse (less for MSA212) and hamster serum albumin. MSA 21 is also cross-reactive with  
15 rabbit serum albumin. With the irrelevant nanobody no binding was observed (not shown).

As a control experiment, a SDS-PAGE was run with the different plasma samples diluted 1/100 in PBS. The gel was stained with coomassie. We can conclude from Figure 3 that albumin levels in all plasma samples are high except for rabbit plasma, with low levels of  
20 albumin.

**Example 9: Expression and purification**

Plasmid was prepared for the binders and was transformed into WK6 electrocompetent cells. A single colony was used to start an overnight culture in LB containing 2% glucose and 100  
25 µg/ml ampicillin. This overnight culture was diluted 100-fold in 300 ml TB medium containing 100 µg/ml ampicillin, and incubated at 37°C until OD<sub>600nm</sub> = 0.5. 1 mM IPTG was added and the culture was incubated for 3 more hours at 37°C or overnight at 28°C.

Cultures were centrifuged for 20 minutes at 10,000 rpm at 4°C. The pellet was frozen overnight or for 1 hour at -20°C. Next, the pellet was thawed at room temperature for 40  
30 minutes, re-suspended in 20 ml PBS and shaken on ice for 1 hour. Periplasmic fraction was isolated by centrifugation for 20 minutes at 4°C at 20,000 rpm. The supernatant containing the nanobody was loaded on Ni-NTA and purified to homogeneity.

**Example 10: ELISA on MSA of the purified nanobodies**

A microtiterplate was coated with 5 µg/ml MSA overnight at 4°C. After washing, the plate was blocked for 2 hours at RT with PBS-1% casein. Samples were applied in duplicate starting at a concentration of 2500 nM at 1/3 dilutions and allowed to bind for 2 hours at RT. A polyclonal rabbit anti-nanobody serum was added at 1/1000 (K208) for one hour at RT. Detection was with anti-rabbit alkaline phosphatase conjugate at 1/1000 and staining with PNPP as described in Example 6. Results are shown in Figure 4.

**Example 11: Construction of bispecific constructs**

The *E. coli* production vector pAX11 was constructed to allow the two-step cloning of bivalent or bispecific VHH (Figure 5).

The carboxy terminal VHH was cloned first with PstI and BstEII, while in the second step the other VHH was inserted by SfiI and NotI, which do not cut within the first gene fragment. The procedure avoids the enforcement of new sites by amplification and thus the risk of introducing PCR errors. The middle hinge of llama was used as a linker between the nanobodies. A VHH against human TNF alpha was cloned at the COOH terminal of MSA specific nanobodies. Sequences are summarized in Table 4 (SEQ ID NOS: 5, 6, 7 and 8). Plasmid was prepared and was transformed into WK6 electrocompetent cells. A single colony was used to start an overnight culture in LB containing 2% glucose and 100 µg/ml ampicillin. This overnight culture was diluted 100-fold in 300 µl TB medium containing 100 mg/ml ampicillin, and incubated at 37°C until OD<sub>600nm</sub>= 0.5. 1 mM IPTG was added and the culture was incubated for 3 more hours at 37°C.

Cultures were centrifuged for 20 minutes at 10,000 rpm at 4°C. The pellet was frozen overnight at -20°C. The next morning, the pellet was thawed in the cold room for 40 minutes, re-suspended in 20 ml PBS and shaken on ice for 1 hour. Periplasmic fraction was isolated by centrifugation for 20 minutes at 4°C at 10,000 rpm. The supernatant was loaded on Ni-NTA and purified to homogeneity. Sequences are shown in Table 4 (SEQ ID NOS: 5, 6, 7 and 8). A extra purification step was needed to remove some degradation product (5%) on gelfiltration.

Another bispecific VHH against human TNF-alpha (MP7 12b) is listed in Table 4 (SEQ ID NOS: 15, 16, 17 and 18).

**Example 12: Test bispecific construct in sandwich ELISA**

A microtiter plate was coated with 5 µg/ml MSA overnight at 4°C. Plates were blocked for two hours at room temperature with 300 µl 1% casein in PBS. The plates were washed three times with PBS-Tween. Purified protein for the bispecific constructs was allowed to bind to the wells of the microtiterplate at a concentration of 0.4, 0.5, 2.5 and 2.5 µg/ml for MSA21, MSA24, MSA210 and MSA212 respectively. Plates were washed six times with PBS-Tween, Biotinilated TNF was added at a concentration of 10 µg/ml and diluted 3 fold, and allowed to bind for 2 hours at room temperature. Binding was detected by incubation with mouse extravidin alkaline phosphatase conjugate (Sigma) 1/2000 in PBS, for 1 hour at RT. Staining was performed with the substrate PNPP (p-nitrophenyl-phosphate, 2 mg/ml in 1M diethanolamine, 1mM Mg<sub>2</sub>SO<sub>4</sub>, pH9.8) and the signals were measured after 30 minutes at 405 nm. Results are shown in Figure 6 and indicate that the bispecific construct can bind both antigens simultaneously.

**Example 13: Determine affinity of albumin binders in BIACORE**

Affinities for mouse albumin were determined in BIACORE by immobilization of mouse albumin on a CM5 BIAcore chip using EDC-NHS covalent coupling and are summarized in Table 5. The results indicate that the affinity for albumin is retained in the bispecific construct.

**Example 14: Optimization of ELISA in plasma or blood**

Pharmacokinetic experiments were initiated to compare half life in mice of the TNF-alpha binder TNF3E with MSA21/VHH#3E and MSA24/ VHH#3E. Therefore our ELISA had to be optimized to obtain low background values when the samples are in blood or in plasma. A microtiterplate was coated with neutravidin. After overnight incubation at 4C, the plates were washed and blocked for 2 hours at RT with PBS-1% casein. 1 µg/ml biotinylated TNF-alpha was allowed to bind for 30 minutes at RT and the plate was washed. Samples (monovalent VHH#3E and MSA21/VHH#3E) were applied starting at a concentration of 1 µg/ml, diluted in PBS, 10% plasma or 10% blood and allowed to bind for 2 hours. After washing the plates, a rabbit antiserum was added at a dilution of 1/2000 either recognizing the heavy chain class (K208) or recognizing the conventional class (URL49). After 1 hour incubation, the plates were washed and an anti-rabbit alkaline phosphatase conjugate was added (Sigma) at a dilution of 1/1000. After 1 hour incubation at RT, plates were washed and binding was

detected with substrate. Results are shown in Figure 7. The results clearly show that background values with the rabbit antisera (K208 and URL49) are very low when the samples are diluted in 10% blood or 10% plasma as compared to PBS. The URL49 antiserum only recognizes the MSA21/VHH#3E bispecific nanobody and not monovalent VHH#3E, therefore,  
5 this antiserum can be used to test the integrity of our bispecific nanobody upon administration to the mice.

**Example 15: Large scale expression and purification of VHH#3E, MSA21/VHH#3E and MSA24/VHH#3E for pharmacokinetic studies in mice**

10

3 liter culture was started for monovalent TNF3E and for bispecific MSA21/VHH#3E or MSA24/VHH#3E and purified as described in Example 11. An extra purification step was needed for the removal of endotoxins. Therefore, samples were purified on a Polymyxin column (BIO-RAD). Samples were analyzed for bacterial endotoxin concentration with the  
15 LAL-assay (Limulus Amebocyte Lysate, Bio Whittaker). Results are summarized in Table 6.

**Example 16: Pharmacokinetics in mice**

9 mice (CB57/Bl6) for each construct were injected intravenously in the tail with 100 µg nanobody. Blood was retrieved at different time points (3 mice per time point) and serum was  
20 prepared. Samples were analyzed by ELISA for the presence of monovalent or bispecific nanobody as described in example 14. K208 was also compared to URL49 for the bispecific constructs to verify the integrity of the molecule. Results are shown in Figures 8 to 11.

We can conclude from the results that the half life of the monovalent nanobody (40-45  
25 minutes) is dramatically improved by making a bispecific nanobody with specificity for albumin MSA21/VHH#3E and MSA24/VHH#3E (half-life 2.5 to 3 days). The bispecific nanobody MSA21/VHH#3E remains intact even after 19 days in the mice as shown in ELISA with URL49 (Figure 11).

**30 Example 17: Further extension of half-life of nanobodies**

In order to increase the half-life of MSA21/TNF3E and MSA24/TNF3E even further, a trivalent nanobody was prepared by fusing the bivalent MSA21-MSA21 construct to target-specific

nanobody TNF3E. The resulting MSA21/MSA21/TNF3E (Table 7, and SEQ ID NO: 9) was tested *in vivo* according to the method of Example 16.

**Example 18: Immunization of llama002**

5 1 llama was immunized with vWF. The immunization scheme is summarized in Table 7.

**Example 19: Repertoire cloning and phage preapration**

The library was prepared as described in Example 2. The size of the library was  $1.4 \times 10^7$  cfu, and >90% of the clones contained insert of the correct size. Phages were prepared as  
10 described in Example 3.

**Example 20: Selection for binders for vWF inhibiting the interaction with collagen: first and second round of panning**

A well in a microtiterplate was coated with 2 µg/ml vWF or with PBS containing 1% casein.  
15 After overnight incubation at 4°C, the wells were blocked with PBS containing 1% casein, for 3 hours at RT. 200 µl phages was added to the wells. After 2 hours incubation at RT, the wells were washed 10x with PBS-Tween and 10x with PBS. Phages were specifically eluted with 100 µl of 100 µg/ml collagen type III. Elutions were performed for overnight at room temperature. Eluted phages were allowed to infect exponentially growing TG1 cells, and were  
20 then plated on LB agar plates containing 100 µg/ml ampicillin and 2% glucose. This experiment was repeated for a second round of panning, under the same conditions as described above. The results from the panning are presented in Tables 8 and 9.

**Example 21: Functional characterization of vWF binders: Inhibition of binding of vWF  
25 to collagen by VHH**

A microtiter plate was coated overnight at 4°C with collagen type III at 25 µg/ml in PBS. The plate was washed five times with PBS-Tween and blocked for 2 hours at room temperature with PBS containing 1% casein. The plate was washed five times with PBS-tween. 100 µl of 2 µg/ml vWF (vWF is pre-incubated at 37°C for 15 minutes) was mixed with 20 µl periplasmic  
30 extract containing a VHH antibody (described in Example 6) and incubated for 90 minutes at room temperature in the wells of the microtiterplate. The plate was washed five times with PBS-tween. An anti-vWF-HRP monoclonal antibody (DAKO) was diluted 3,000-fold in PBS and incubated for 1 hour. The plate was washed five times with PBS-Tween and vWF-binding

was detected with ABTS/H<sub>2</sub>O<sub>2</sub>. Signals were measured after 30 minutes at 405 nm. The results are presented in Table 10, showing that inhibitors are obtained after the first and second round of panning.

5    **Example 22: Expression and purification of VHH**

Protein was prepared and purified as described in Example 9.

10    **Example 23: ELISA: binding to vWF**

A microtiter plate was coated with 2 µg/ml vWF, overnight at 4°C. Plates were blocked for two  
10    hours at room temperature with 300 µl 1% casein in PBS. The plates were washed three  
times with PBS-Tween. Dilution series of all purified samples were incubated for 2 hours at  
RT. Plates were washed six times with PBS-Tween, after which binding of VHH was detected  
by incubation with mouse anti-myc mAB 1/2000 in PBS for 1 hour at RT followed by anti-  
mouse-HRP conjugate 1/1000 in PBS, also for 1 hour at RT. Staining was performed with the  
15    substrate ABTS/H<sub>2</sub>O<sub>2</sub> and the signals were measured after 30 minutes at 405 nm. The  
binding as a function of concentration of purified VHH is indicated in Figure 12.

20    **Example 24: Inhibition ELISA with purified VHH**

Inhibition ELISA was performed as described in Example 20 but with decreasing  
20    concentrations of VHH and with human plasma at a dilution of 1/60 instead of with purified  
vWF. Results are represented in Figure 13. The concentration of VHH resulting in 50%  
inhibition (IC<sub>50</sub>) is given in table 10.

25    **Example 25: Construction and sequence of bispecific constructs**

Bispecific constructs were prepared with the first VHH specific for albumin (MSA21) and the  
25    second VHH specific for vWF. Constructs were made as described in Example 11.  
Sequences are shown in Table 4 (SEQ ID NOS: 19 to 21)

30    **Example 26: Expression and purification of bispecific constructs**

Protein was expressed and purified as described in Example 9. An extra purification step was  
30    needed on superdex 75 for removal of some monovalent degradation product (5-10%).

**Example 27: Functionality of both VHHs in the bispecific construct**

A microtiterplate was coated with 5 µg/ml mouse serum albumin overnight at 4°C. After washing the plate, wells were blocked for 2 hours with PBS-1% casein. The bispecific proteins were allowed to bind to the wells for 2 hours at RT. After washing, human, dog and pig plasma was added at different dilutions and allowed to bind for 2 hours at RT. Binding of vWF was detected with anti-vWF-HRP from DAKO at 1/3000 dilution. Staining was performed with ABTS/H<sub>2</sub>O<sub>2</sub>. Results are shown in Figure 14 and indicate that functionality of both VHHs is retained in the bispecific construct.

**Example 28: Inhibition of binding of vWF to collagen by the bispecific constructs as compared to the monovalent VHHs**

Inhibition for binding of vWF to collagen was tested for monovalent as compared to bispecific constructs as described in Example 20. IC<sub>50</sub> values are summarized in Table 11. Results indicate that the inhibitory properties of the VHH are retained in the bispecific construct.

15

**Example 29: Construction of a bispecific construct containing a VHH-CDR3 fragment fused to an anti-serum albumin VHH**

A functional portion, the CDR3 region of MP2F6SR, was amplified by using a sense primer located in the framework 4 region (F6 CRD3 Forward:CTGGCCCCAGAAGTCATACC) and an anti-sense primer located in the framework 3 region (F6 CDR3 Reverse primer:TGTGCATGTGCAGCAAACC).

In order to fuse the CDR-3 fragment with the anti-serum albumin VHH MSA-21, a second round PCR amplification was performed with following primers:

25 F6 CDR3 Reverse primer Sfi1:

GTCCTCGCAACTGCGGCCAGCCGGCCTGTGCATGTGCAGCAAACC

F6 CDR3 Forward primer Not1:

GTCCTCGCAACTGCGGCCAGCCGGCCTGGCCCCAGAAGTCATACC

30 The PCR reactions was performed in 50 µl reaction volume using 50pmol of each primer. The reaction conditions for the primary PCR were 11 min at 94 °C, followed by 30/60/120 sec at 94/55/72 °C for 30 cycles, and 5 min at 72°C. All reaction were performed with 2.5 mM MgCl<sub>2</sub>, 200 mM dNTP and 1.25U AmpliTaq Gold DNA Polymerase (Roche Diagnostics, Brussels, Belgium).

After cleavage of the VHH gene of MSA clones with restriction enzymes Pst1/BstEII the digested products were cloned in pAX11 to obtain clones with a VHH at the C-terminus of the multicloning site. The clones were examined by PCR using vector based primers. From clones yielding a 650 bp product, DNA was prepared and used as acceptor vector to clone  
5 the CDR3 of MP2F6SR after cleavage of the PCR product with restriction enzymes Sfi1/Not1 to allow N-terminal expression of CDR3 in fusion with a MSA VHH.

**Example 30: Calculation of homologies between anti-target single domain antibodies of the invention**

10 The degree of amino acid sequence homology between anti-target single domain antibodies of the invention was calculated using the Bioedit Sequence Alignment Editor. The calculations indicate the proportion of identical residues between all of the sequences as they are aligned by ClustalW. (Thompson, J.D., Higgins, D.G. and Gibson, T.J. (1994) CLUSTAL  
15 W: improving the sensitivity of progressive multiple sequence alignment through sequence weighting, position specific gap penalties and weight matrix choice. Nucleic Acids Research, submitted, June 1994). Table 12 indicates the fraction homology between anti-serum albumin VHHs of the invention. Table 13 indicates the fraction homology between anti-TNF-alpha  
20 VHHs of the invention. Table 14 indicates the percentage homology between anti-IFN-gamma VHHs of the invention. Table 15 indicates the fraction homology between anti-vWF VHHs of the invention.

**Table 1: Immunization scheme according to Example 1**

Day of immunization	HSA Llama006
0	100 µg
7	100 µg
14	50 µg
21	50 µg
28	50 µg
35	50 µg

5 **Table 2: results after one and two rounds of panning on mouse serum albumin as described in example 5.**

	First round	Second round
Pfu mouse serum albumin	$2.5 \times 10^7$	$2.5 \times 10^7$
Pfu casein	$5 \times 10^3$	$2.5 \times 10^3$
enrichment	5,000	10,000

10 **Table 3: Clones were selected after one and two rounds of selection and periplasmic extracts were prepared. These clones were analyzed in ELISA for binding to human and mouse albumin as described in Example 6.**

	First round	Second round
ELISA mouse serum albumin	1/16	15/16
ELISA human serum albumin	1/16	15/16
ELISA casein	0/16	0/16

**CLAIMS**

1. A polypeptide construct comprising:
  - at least one single domain antibody directed against a therapeutic and/or diagnostic target,
  - 5 and
  - at least one single domain antibody directed against a serum protein.
2. A polypeptide construct according to claim 1 wherein:
  - the number of anti-target single domain antibodies is at least two, and
  - 10 - at least two anti-target single domain antibodies do not share the same sequence, or all the anti-target single domain antibodies share the same sequence.
3. A polypeptide construct according to claim 1 wherein:
  - the number of anti-serum protein single domain antibodies is at least two, and
  - 15 - at least two anti-serum-protein single domain antibodies do not share the same sequence, or all the anti-serum-protein single domain antibodies share the same sequence.
4. A polypeptide construct according to any of claims 1 to 3 wherein at least one single domain antibody is a *Camelidae* VHHs antibody.
- 20 5. A polypeptide construct according to any of claims 1 to 4 wherein at least one single domain antibody is a humanised *Camelidae* VHHs antibody.
6. A polypeptide construct according to any of claims 1 to 5 wherein said serum protein is any
- 25 of serum albumin, serum immunoglobulins, thyroxine-binding protein, transferring, or fibrinogen or a fragment thereof.
7. A polypeptide construct according to claim 1 to 6 wherein a single domain anti-serum protein antibody correspond to a sequence represented by any of SEQ ID NOs: 1 to 4, and
- 30 28 to 40.
8. A polypeptide construct according to any of claims 1 to 7 wherein a target is TNF-alpha-alpha.

9. A polypeptide construct according to claim 7 corresponding to the sequence represented by any of SEQ ID NO: 5 to 18.
10. A polypeptide construct according to any of claims 8 to 10, wherein said polypeptide construct is a homologous sequence of said polypeptide construct, a functional portion of said polypeptide construct, or an homologous sequence of a functional portion of said polypeptide construct.
11. A nucleic acid encoding a polypeptide construct according to any of claims 8 to 10.
12. A polypeptide construct according to any of claims 8 to 10, or a nucleic acid according to claim 11 for use in the treatment, prevention and/or alleviation of disorders relating to inflammatory processes.
13. Use of a polypeptide construct according to any of claims 8 to 10, or a nucleic acid according to claim 11 for the preparation of a medicament for the treatment, prevention and/or alleviation of disorders relating to inflammatory processes.
14. A polypeptide construct or nucleic acid according to claim 13 or a use of a polypeptide construct according to claim 13 wherein said disorders are any of rheumatoid arthritis, Crohn's disease, ulcerative colitis and multiple sclerosis.
15. A polypeptide construct or nucleic acid according to claims 12 and 14 or a use of a polypeptide construct according to claim 13 and 14 wherein said polypeptide construct is administered intravenously, orally, sublingually, topically, nasally, vaginally, rectally, subcutaneously or by inhalation.
16. A polypeptide construct according to any of claims 1 to 7 wherein a target is vWF
17. A polypeptide construct according to claims 1 to 7 wherein a target is collagen.
18. A polypeptide construct according to claim 16 wherein at least one anti-target single domain antibody is anti-vWF VHHs.

19. A polypeptide construct according to claim 18 corresponding to the sequence represented by any of SEQ ID NOs: 19 to 21.
20. A polypeptide construct according to any of claims 16 to 19, wherein said polypeptide construct is a homologous sequence of said polypeptide construct, a functional portion of said polypeptide construct, or an homologous sequence of a functional portion of said polypeptide construct.
21. A nucleic acid encoding a polypeptide construct according to any of claims 16 to 20.
22. A polypeptide construct according to any of claims 16 to 20, or a nucleic acid according to claim 21 for use in the treatment, prevention and/or alleviation of disorders or conditions relating to platelet-mediated aggregation or dysfunction thereof.
23. Use of a polypeptide construct according to any of claims 16 to 20, or a nucleic acid according to claim 21 for the preparation of a medicament for the treatment, prevention and/or alleviation of disorders or conditions relating to platelet-mediated aggregation or dysfunction thereof.
24. A polypeptide construct or nucleic acid according to claim 22 or a use of a polypeptide construct or nucleic acid according to claim 23 wherein said disorders are any of cerebral ischemic attack, unstable angina pectoris, cerebral infarction, myocardial infarction, peripheral arterial occlusive disease, restenosis, and said conditions are those arising from coronary by-pass graft, or coronary artery valve replacement and coronary interventions such as angioplasty, stenting, or atherectomy.
25. A polypeptide construct or nucleic acid according to claims 22 and 24 or a use of a polypeptide construct according to claim 23 and 24 wherein said polypeptide construct is administered intravenously, orally, sublingually, topically, nasally, vaginally, rectally, subcutaneously or by inhalation.
26. A polypeptide construct according to any of claims 1 to 7 wherein a target is IgE.

27. A polypeptide construct according to claim 26 wherein at least anti-target single domain antibody is anti-IgE VHHs.

28. A polypeptide construct according to claim 26 corresponding to the sequence represented by any of SEQ ID NOs: 22 to 24.

29. A polypeptide construct according to any of claims 26 to 28, wherein said polypeptide construct is a homologous sequence of said polypeptide construct, a functional portion of said polypeptide construct, or an homologous sequence of a functional portion of said polypeptide construct.

30. A nucleic acid encoding a polypeptide construct according to any of claims 26 to 29.

31. A polypeptide construct according to any of claims 26 to 29, or a nucleic acid according to claim 30 for use in the treatment, prevention and/or alleviation of disorders or conditions relating to allergic reactions.

32. Use of a polypeptide construct according to any of claims 26 to 29, or a nucleic acid according to claim 30 for the preparation of a medicament for the treatment, prevention and/or alleviation of disorders or conditions relating to allergic reactions.

33. A polypeptide construct or nucleic acid according to claim 31 or a use of a polypeptide construct or nucleic acid according to claim 32 wherein said disorders are any of hay fever, asthma, atopic dermatitis, allergic skin reactions, allergic eye reactions and food allergies.

34. A polypeptide construct or nucleic acid according to claims 31 and 33 or a use of a polypeptide construct according to claim 32 and 33 wherein said polypeptide construct is administered intravenously, orally, sublingually, topically, nasally, vaginally, rectally, subcutaneously or by inhalation.

35. A polypeptide construct according to any of claims 1 to 7 wherein a target is IFN-gamma .

36. A polypeptide construct according to claim 35 wherein at least one anti-target single domain antibody is anti-IFN-gamma VHHs.

37. A polypeptide construct according to claim 35 corresponding to a sequence represented  
5 by SEQ ID NOs: 25 to 27.

38. A polypeptide construct according to any of claims 35 to 37, wherein said polypeptide  
construct is a homologous sequence of said polypeptide construct, a functional portion of said  
polypeptide construct, or an homologous sequence of a functional portion of said polypeptide  
10 construct.

39. A nucleic acid encoding a polypeptide construct according to any of claims 35 to 38.

40. A polypeptide construct according to any of claims 35 to 38, or a nucleic acid according to  
15 claim 39 for use in the treatment, prevention and/or alleviation of disorders or conditions  
wherein the immune system is over-active.

41. Use of a polypeptide construct according to any of claims 35 to 38, or a nucleic acid  
according to claim 39 for the preparation of a medicament for the treatment, prevention  
20 and/or alleviation of disorders or conditions wherein the immune system is over-active.

42. A polypeptide construct or nucleic acid according to claim 40 or a use of a polypeptide  
construct or nucleic acid according to claim 41 wherein said disorders are any of Crohn's  
disease, autoimmune disorders and organ plant rejection in addition inflammatory disorders  
25 such as rheumatoid arthritis, Crohn's disease, ulcerative colitis and multiple sclerosis.

43. A polypeptide construct or nucleic acid according to claims 40 and 42 or a use of a  
polypeptide construct according to claim 41 and 42 wherein said polypeptide construct is  
administered intravenously, orally, sublingually, topically, nasally, vaginally, rectally,  
30 subcutaneously or by inhalation.

44. A composition comprising a polypeptide construct according to any of claims 8 to 10, 12, 14 and 15, or a nucleic acid encoding said polypeptide construct and a pharmaceutically acceptable vehicle.
- 5 45. A composition comprising a polypeptide construct according to any of claims 16 to 20, 22, 24 and 25, or a nucleic acid encoding said polypeptide construct and a pharmaceutically acceptable vehicle.
- 10 46. A composition comprising a polypeptide construct according to any of claims 26 to 29, 31, 33 and 34, or a nucleic acid encoding said polypeptide construct and a pharmaceutically acceptable vehicle.
- 15 47. A polypeptide construct according to any of claims 1 to 7 directed against a single target wherein said target is involved in a disease process.
48. A polypeptide construct according to claim 47, wherein said polypeptide construct is a homologous sequence of said polypeptide construct, a functional portion thereof, of an homologous sequence of a functional portion thereof.
- 20 49. A nucleic acid encoding a polypeptide construct according to claims 47 and 48.
50. A polypeptide construct according to claims 47 and 48, or a nucleic acid according to claim 49 for use in the treatment, prevention and/or alleviation of disorders or conditions in which the target is involved.
- 25 51. Use of a polypeptide construct according to any of claims 47 and 48, or a nucleic acid according to claim 49 for the preparation of a medicament for the treatment, prevention and/or alleviation of disorders or conditions in which the target is involved.
- 30 52. A polypeptide construct according to claims 48 and 50, or a nucleic acid according to claim 49 for use in treating, preventing and/or alleviating the symptoms of a disease requiring a therapeutic or diagnostic compound which is not rapidly cleared from the circulation.

53. Use of a polypeptide construct according to any of claims 48 and 50, or a nucleic acid according to claim 49 for the preparation of a medicament for treating, preventing and/or alleviating the symptoms of a disease requiring a therapeutic or diagnostic compound which is not rapidly cleared from the circulation.

5

54. A polypeptide construct according to any of claims 48 and 50, or a nucleic acid according to claim 49 for use in treating, preventing and/or alleviating the symptoms of a disease requiring a therapeutic or diagnostic compound which remains active in the circulation for extended periods of time.

10

55. Use of a polypeptide construct according to any of claims 48 and 50, or a nucleic acid according to claim 49 for the preparation of a medicament for treating, preventing and/or alleviating the symptoms of a disease requiring a therapeutic or diagnostic compound which is remains active in the circulation for extended periods of time.

15

56. A polypeptide construct or nucleic acid according to any of claims 50, 52, 54, or use of a polypeptide construct or nucleic acid according to any of claims 51, 52, 53, 55, wherein said polypeptide construct is administered intravenously, orally, sublingually, topically, nasally, vaginally, rectally, subcutaneously or by inhalation.

20

57. A composition comprising a polypeptide construct according to any of claims 1 to 7, 47, 48, 50, 52, 54 and 56, or a nucleic acid according to any of claims 49, 50, 52, 54 and 56 and a pharmaceutically acceptable vehicle.

25

58. A method of producing a polypeptide according to any of claims 1 to 10, 16 to 20, 26 to 29, 47 and 48 comprising

(a) culturing host cells comprising nucleic acid capable of encoding a polypeptide according to any of claims 1 to 10, 16 to 20, 26 to 29, 47 and 48, under conditions allowing the expression of the polypeptide, and,

30

(b) recovering the produced polypeptide from the culture.

59. A method according to claim 58, wherein said host cells are bacterial or yeast.

60. A method for prolonging the half-life of a single domain antibody in the blood stream of a subject, said antibody directed against a therapeutic and/or diagnostic target by joining thereto one or more single domain antibodies directed against a serum protein.

5 61. A method according to claim 60 wherein said anti-target single domain antibodies do not share the same sequence.

62. A method according to claim 60 wherein said anti-serum protein single domain antibodies do not share the same sequence.

10

63. A method according to claim 60 wherein said single domain antibodies are *Camelidae* VHH antibodies.

15 64. A method according to any of claims 60 to 63 wherein said serum protein is any of serum albumin, serum immunoglobulins, thyroxine-binding protein, transferrin, or fibrinogen or a fragment thereof.

20 65. A method according to any of claims 60 to 64 wherein said serum protein comprises a sequence corresponding to any of SEQ ID NOs: 1 to 4, a homologous sequence, a functional portion thereof, or a homologous sequence of a functional portion thereof.

66. A composition comprising a polypeptide according to any of claims 1 to 7 or a nucleic acid capable of encoding said polypeptide and a pharmaceutically acceptable vehicle.
